**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
The gulf oil spill only shines a laser on the precarious state of our shoreline.... SO MUCH IS AT RISK.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
I have vacationed in the Outer Banks for the past several years and one of the highlights of our trips is spending time on the beaches; in our ORV and on foot. Being an avid bird-lover, a large part of the beach experience for me is watching the shorebirds. With each passing year, I wonder how all the ORVs have been impacting the beaches, nest sites, and cleanliness (disposed fishing line, etc.). If we restrict more beaches for non-ORV use, then hopefully a better balance can be obtained. An alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. I am writing as someone who spends vacation time there and at other national seashores, observing wildlife and supporting local business with my vacation expenditures.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs are given an unfair advantage in access over non-ORV users and wildlife. Allowing ORV's on 76 percent of the seashore is just plain unfair and disruptive to wildlife that rely on beaches to survive. If ORV use is allowed within the park, at least half of the beach should be available year round for . Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Protection of the natural resources and wildlife of the Seashore should come first. Recreational use should be consistent with this protection. **Correspondence:** Dear Mr. Murray,  
NPS Resource Management Pedestrian / ORV Closure Policies Address the Least Significant Factor Affecting Nest Survival with Little Chance to Have more than Negligible Impact ?for example: ? AMOY Nest Failures are Predominately due to Non-human Events ? Mammalian Predation: 54% ? Storm / Lunar Tides: 29% ? Nest Abandonment: 6% ? Avian Predation: 5% ? Ghost Crab Predation: 3% ? Human Interference: 3% Insignificant Impact  
Creating huge buffers for birds that are not on the ESA is impacting humans. Why aren't alternatives being promoted? I would recommend educating the public in reference to respecting wildlife and sharing the beach. This may cost more money than just shutting down access, but it will be money well spent.  
The restrictions on access are having an adverse affect on the birds. People don't see the Piping Plover as a wonder of nature, but as a barrier to their beloved beaches. This is only going to get worse as more and more closures happen when more birds decide to nest in prime recreational areas. I think it is incumbent on the NPS to find ways for the birds and humans to share the beach. Think outside the box of restricting ORV access. How about working with the OBPA and NCBBA to adopt nesting areas? Empowering members to actively monitor sites while reducing buffer zones. They are out there everyday.  
My college degree is in biology. I have been visiting Hatteras Island for the past 35 years. I learned to respect nature by spending time on the beaches of Hatteras Island.  
Don't deny access to future nature lovers.  
Sincerly,  
Dave Farmer

The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
Given the disaster we see in now in the Gulf of Mexico, protecting sensitive nesting areas on all of coasts should be a top priority for the National Park Service. If we lose the nesting areas as projected in Louisiana and the Gulf coast, we can't afford to do anything to damage other nesting areas. Cape Hatteras may be one of the few areas we have left!  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

As a someone who has visited Cape Hattares National Seashore and supported the local tourist economy, I am writng to encourage that the ORVs be restricted as per the alternate plan. This resource must be managed to preserve wildlife and allow access for those who appreciate the solitude and wildlife viewing without ORVs..

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be allowed access to 76 percent of the 68 total miles of Seashore beach. This is unfair and excessive!!! This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Protection of the natural resources and wildlife of the Seashore fir. , The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. **Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
Dear Mr. Murray,  
Thank you for listening to my comments on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at

least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** 1. Predator Control/ Vegetation Removal around the salt ponds  
I disagree with the proposed continued trapping and slaughter of native predators. I do agree, however, with removal of exotic mammals. Predators have thrived here because THEIR natural predators, humans, have been so widely restricted (particularly at night when risk is greatest) and because the NPS has permitted vegetation to grow around the ponds. Why is it OK to tamper with nature in some instances (killing mammals) but not in others (clearing vegetation)? Vegetation removal would provide more and safer feeding areas for plovers.  
2. 1000 Meter Radius Buffers for Piping Plovers (p. 121-127)  
This is preposterously excessive and inflexible for a threatened species which will soon be delisted. The unfledged chick buffer should be adjusted as the brood moves to find food, not simply expanded. Show me the science. As there has NEVER been a piping plover death attributable to an ORV

driver, there should be drive-thru access corridors.

3. Prohibition of Family Pet Dogs (p. 136)

The DEIS is contradictory on what policy will be. I agree that unleashed pets should not be allowed, but there is no reason at all why leashed pets and their families should be punished.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

Please note that not only will this protect wildlife, ORV are dangerous and result in many needless human injuries every year. Restriction of their use can only improve public safety and health...

Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
Ce plan de rechange serait de fournir plus de possibilit?s pour des utilisations non-VHR sur les plages et le r?sultat en moins de perturbation de la faune, qui sont importantes pour moi.  
Les principes suivants devraient sous-tendre l'?laboration du parc de son plan final, devrait-il pas choisi d'adopter la variante D:  
\* Fournir un acc?s ?gal pour tous les visiteurs. Selon le plan de pr?f?rer le National Park Service, la variante F, VTT serait interdite toute l'ann?e sur seulement 16 des 68 miles de la plage totale Seashore. Cela ne repr?sente pas un juste ?quilibre pour les autres utilisateurs et de la faune. Si l'utilisation des VHR est autoris? dans le parc, au moins la moiti? de la plage doivent ?tre disponibles toute l'ann?e pour les utilisateurs non-VTT et de la faune. Combin?s avec plus trottoirs et des installations d'un meilleur acc?s, cette approche serait de fournir un acc?s ?quilibr? pour tous les visiteurs. Les pi?tons et les familles pourraient alors plus jouer en toute s?curit? la mer, et de la faune pourrait avoir une chance de rebond ? ses num?ros traditionnels et de diversit? dans le parc.  
\* Put Ressources naturelles abord. Protection des ressources naturelles et de la faune du littoral devrait venir en premier, et l'utilisation r?cr?ative devrait ?tre compatible avec cette protection. Le plan pr?f?r? ne parvient pas ? cr?er des zones ad?quates qui sont exempts de toute VHR utilisent annuellement pour la faune, y compris la reproduction, de migration et d'hivernage des esp?ces. protection de la faune doit ?tre fond? sur les meilleures informations scientifiques. tampons perturbation de la faune dans le plan pr?f?r?s sont minimales et devrait ?tre augment? si n?cessaire pour prot?ger les oiseaux nicheurs et les tortues marines.  
\* Fixer et atteindre des objectifs clairs pour le r?tablissement de la faune. Un plan doit inclure des objectifs clairs et des ?tapes pour la r?cup?ration de la faune. Lorsqu'il existe des objectifs de gestion dans le DEIS, ils ont besoin vetting plus approfondie, bas?e sur le potentiel de la mer pour nourrir les animaux sauvages plut?t que sur ses derni?res capacit?s d?grad?es. L'? les oiseaux, les tortues, et les plantes ne sont pas revenir comme pr?vu, sur la base des examens annuels, d'autres mesures de protection doivent ?tre mises en oeuvre jusqu'? ce que les objectifs de r?tablissement sont remplies. Ces objectifs et de gestion ad?quates pour les r?aliser, il convient de migration et d'hivernage des esp?ces ainsi que celles de reproduction.  
Je vous remercie de l'opportunit? de fournir ? ces commentaires. Je vais suivre les progr?s de vos efforts ? Cape Hatteras et attendons avec impatience un plan plus final ?quilibr? pour tous les visiteurs qui prot?ge mieux les ressources naturelles de la c?te.

**Correspondence:** Michael B. Murray Superintendent  
Dear Mr. Murray:  
Please pass and implement this plan to block vehicles on the beaches of the Outer Banks - specifically on Hatteras Island!  
I moved to southeastern Virginia about a year ago. I still maintain my home in NC and have watched the numerous changes wrought on the Outer Banks over the years. I have seen beautiful "sleepy" fishing villages turned into built-up vacation hot-spots for spoiled "out-of-towners". I have lived and worked in the Outer Banks. I am well aware that, to a large degree, the area relies on the income generated by tourism.  
I whole-heartedly support tourism to the Outer Banks. The area has a beauty unmatched in many other areas of our country and should be shared and enjoyed with our country's citizens. There is however, a difference between the tourist who comes with their family to vacation for a week or two and the spoiled, short-sighted individuals who believe it is "ok" to damage crucial beaches in the name of their selfish choice of "recreation".  
These last few days, living in the Tidewater Virginia area, I have watched with disbelief and disgust, the various news reports of open forums conducted on this proposal. Each of these news reports have focused on what benefit Virginians might lose if this proposal is implemented. Hello?!? The Outer Banks was not created/formed to be anyone's personal playground! I have yet to see any responsible reporting to this area's citizenry regarding the ecological impact of ORVs on area beaches. Why is that I wonder?

0009367

I believe that those arguing that they have a right to use their ORVs to travel to secluded spots for "great fishing" represent a group of individuals who simply think of their own instant gratification - not of the long-term effects to the ecosystem of the Cape Hatteras National Seashore. I understand wanting to partake in the great sport of fishing - I too have enjoyed fishing over the years. What I do not understand or condone is the possible damage or worse, destruction of the delicate ecosystem in question just to support my hobby. We all must think beyond our short-term perceived "needs" and wants to the long-term health of our natural resources. Our beaches, with their varied flora and fauna ARE in fact one of America's greatest treasures and should be preserved for those generations who come after us.

I for one, am willing to sacrifice my short-term desire to use my ORV to bring my family to the various secluded spots along Hatteras. I choose to think and believe globally and long-term for all of those who will follow me in successive generations.

I implore you to preserve Cape Hatteras National Seashore by banning ORVs in ecologically sensitive areas. I believe future generations of Americans will thank you for it!!!

---

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

I hope you will choose the "environmentally preferred" Alternative D to provide better access by pedestrians. Management of this area is critical for the survival of bird species that may be harmed by ORV.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

Please do something about off road vehicles and protect the nesting area for birds and sea turtles. Wild life can use all the help it can get now and thank you.Jean hooper.

Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.
- \* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.
- \* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

- \*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

 I'm a photographer who has been almost run over by those dune buggies and other 4 wheel vehicles. The last time we were there, we vowed not to return because of the danger from ORV's. It's a beautiful place but not worth the chances of being hit.

Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are

management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
I do not use ORV, and I do not plan to, yet I visit many of our National Parks, including the Cape Hatteras National Seashore. I do not like ORVs, or their pollution, or their noise. ORV use increases the amount of improperly disposed trash in wild areas. All these results of ORV use seriously degrades my enjoyment of natural areas because it damages the wildlife, land, and wild experience that I come to enjoy. Alternative D is the alternative I prefer.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. \* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding,

migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

The world is losing its wildlife at an alarming rate. Global warming is a grow threat because of the continued rise in the release of CO2, which ORVs exacerbate. The rise in sea level predicted to accompany rising global temperatures is a major threat to all our coasts. Noise pollution is a growing problem. What good is preserving wild areas if human use is allowed to degrade those very characteristics that make wild areas attractive? Please address these problems by restricting the use of ORVs on the Cape Hatteras National Seashore.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this

approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at

least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. \*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at

least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** To Whom it May Concern (and this should concern everyone)  
I am an avid outdoor enthusiast and care deeply about our natural environment. I am, however, gravely concerned about the misguided attempts to protect several species of birds that nature, quite obviously, has selected for extinction. I believe that limiting human access, in any form, to our National Seashores is shortsighted and very narrow-minded. This is not to imply that our coastal environment should be a free-for-all. In fact, I fully support the enforcement and regulation on any abuses that may occur near the seashore, including excessive noise, excessive speed, disorderly conduct, treading on fragile dune grasses, and improper waste disposal. I do, however, believe that our National Seashores are treasures that should be enjoyed by all without restrictions, during any time of year, regardless of which piping plover or loggerhead turtle decided to nest there.  
I have enjoyed Cape Hatteras National Seashore in the off-season for the past several years, and I do enjoy the OHV access to the beaches. I see no

reason why to restrict this OHV access during the shoulder seasons. It is difficult for me to comment on the months of June, July and August, since I have never visited OBX during that time. I can say, however, that there are several beaches near my home that I frequent during the summer months and offer OHV access, and there does not seem to be any problem with the destruction of the natural environment.

This is a slippery slope that you are treading on. The National Seashores are designated to be public lands. Restricting access is not the correct path to follow.

**Correspondence:** To Whom it May Concern, I would like to comment on the proposed pet/horse ban on the seashore from March 15 to July 31st. My husband and I run a very small horseback riding business on the beach in the area of Ramp 55 in Hatteras. Our business is the only way that some individuals get to experience the beach. We take children, elderly and handicapped individuals. We walk with the people and do not ride horses so that we can be there to answer questions and keep the horses in control. I do not believe our horses are a threat to the wildlife. On the contrary, it is a most natural way to experience the seashore. Our business and livelihood would be destroyed by the proposed ban.  
Respectfully,  
Suzie Scholten

Thank you for the support of protection of wildlif. I myself am a birdwatcher ("birder"), and over the years, I have seen degradation of much habitat.

This is a loss for generations to come. We need to do all we can to be stewards of our resouces, not plunderers.

I will be following the progress of your efforts at Cape Hatteras. I support a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I am in favor of reasonable measures to protect birds and turtles, like almost everyone who lives on these islands.

However, the 1,000 meter buffers for some species is absolutely, completely and totally unreasonable.

On our islands, one brood of Plovers at Ocracoke, in 2009, is the only group that has ever been observed to have chicks roam that far after hatching ... and they only did it once and never re-traced their steps! They simply had to go that far to get to a food source from the nest site, and once at the food site, they stayed there. So, how can it be reasonable to base policy on this one extreme case that has never been repeated on these islands?

Where is the reason and common sense in our policy makers?

How can it make sense to completely close a circle with A RADIUS OF 10 FOOTBALL FIELDS around every Piping Plover nest based on one observation of a brood who moved that far ONE TIME to get to food and then never left the food area until they could fly!!! Doesn't the NPS realize that, in many places, our island isn't even one football field wide? It's just that the NPS is either afraid of or too slothful to deal with the folks that have the money to hire expensive lawyers.

When we only have very few Plover nests each year, how difficult could it be for our Park Service folks to establish reasonable and flexible buffers around those nests and then modify them as the brood is observed in it's search for food to establish the protected area in whatever direction that turns out to be?

Contrast that with putting a fixed 20-football-field bubble over each pair observed "exhibiting nesting behavior" that stays in place, regardless, until their brood fledges?

Which seems like the most reasonable and effective management plan?

Which one seems like a "set it and forget it" BUREAUCRATIC PERSONIFICATION OF IRRESPONSIBILITY to both the birds and the people?

And, how is it good policy for the Park Service to refuse to consider many protected birds that are choosing to nest on predator-free dredge islands in the sound instead of the open beach when they count birds to determine success or failure of their policies?

What was wrong with the Interim ORV Plan or something akin to it? Where is the evidence that things were getting worse for birds and turtles on these islands? When the thriving, non-predator-threatened birds on our dredge islands are counted, THERE ISN'T ANY EVIDENCE!  
Come on NPS, stop cowering in front of the Audubon Society and start serving the public who will not stand for their Cape Hatteras National Seashore RECREATIONAL Area being turned into another National Wildlife Refuge! We already have Pea Island + Alligator River + many more ... enough already!

**Correspondence:** Comments on Document 2010 03Mar 05 - Draft ORV Management Plan/EIS

After reviewing the proposed plan I have several comments that I would like to make regarding the extreme measures of restrictions being considered at Cape Hatteras National Seashore Recreation Area (CHNSRA). No other NPS seashore has ever had such extreme resource protection measures in place and the delicate balance between protection and accessibility has been kept in those instances. For your reference, Padre Island National Seashore (PAIS) founded September 28, 1962 is strikingly similar to CHNSRA both in geographic and wildlife make up. What PAIS does not have are total beach closures because of resource protection areas, enormous buffer zones. They have turtles that nest in the park just like CHNSRA. They have about 380 species of birds that have been observed there, this is approximately 45% of all bird species documented in North America. Included in that list is the Piping plover (10% of the world's population @ PAIS), Least Terns (8% of the North American population @PAIS), and the endangered Snowy Plover that call Padre their home -- at least for part of the year. This is because of the island's location on the central flyway, a major migratory route between the northern and southern habitats. CHNSRA bird populations pale in comparison to those numbers. Yet somehow the measures in place at PAIS are able to sufficiently strike a balance between humans and nature. The proposed plan for CHNSRA is overly restrictive for an insignificant percentage of the total population of wildlife that it is intended to protect. Addressing the proposed plan in its entirety, my request is that the CHNSRA final plan be modeled closely after the plan already in place at Padre Island for these many years. The PAIS plan strikes a fine balance between resource/wildlife protection and access to the resource(s) and there is no reason the very same plan would not work equally well at CHNSRA if not better.

Pertaining to specific areas in the proposed plan (Park Service preferred Alternative F) I will break my comments down into the following four areas?Corridors, Management Buffers, Non-Endangered Birds, and Turtle management.

? Corridors-DEIS Pages xii, xviii, and 468- The final plan should include corridors in both ML-1 and ML-2 portions of SMA's. Corridors are a vital tool in providing access while still managing resources. They provide a small path around temporary resource closures in order to provide access to open area that would otherwise be blocked. Corridors should be permitted throughout the seashore during the entire breeding and nesting season including ML-1 portions of SMA's. These corridors would provide valuable access without impairment or damage to protected resources. ? Management Buffers ?DEIS pages 121 to 127- The closures caused by the buffers as enumerated in the Park Service preferred Alternative F are larger and more restrictive than what are required by the various species recovery plans. For example, Piping Plover unfledged chicks, are given a protective buffer of a minimum of 1,000 meters in all directions. This 1,000 meter buffer represents a 500% increase over the standard 200 meter buffer enumerated the Piping Plover recovery plan. Buffers, or closures, are important management practices for species recovery. However, to have long term benefit for the wildlife and the visiting public, buffers must be based on peer-reviewed science. For example, the Piping Plover, a species classified as threatened and not endangered, is given a level of unprecedented protection in Alternative F. A 1,000 meter buffer in all directions represents over 771 acres. The DEIS does not cite any peer-reviewed science in supporting such closure. A more appropriate & effective buffer would be 200 meters.

? Non-Endangered Birds - DEIS pages 121 to 127- Non-endangered species, such as American Oystercatchers, Least Terns and Colonial Waterbirds are given Pre-Nesting closures and buffers up to 300 meters. Birds that are not listed as endangered should not be afforded the level of protection given to ESA (Endangered Species Act) protected species. Instead of 300 meter buffers for these birds, a more appropriate buffer would be 30 meters. Also, all birds in the same ecosystem of the seashore should be counted. This would include all the many birds on the dredge and spoil islands located just yards away and within sight of the seashore.

? Turtle Management - DEIS pages 125, and 392 to 396- DEIS claims North Carolina Wildlife Resources Commission turtle guidelines will be followed. The National Park Service should consider turtle management practices successfully used in other federal and state areas to achieve nesting success. More proactive measures include relocating nests to more desirable locations, which is routinely and successfully done in other areas. This concludes my remarks regarding the Draft ORV Management Plan/EIS. It is my sincere hope that my recommendations will be thoughtfully considered and addressed in the final rule. When these aforementioned items are contained within the final rule it will then be a true representation of a fine balance between resource protection and visitor access.

Thank you for all of your hard work that has and is yet to come. Gary D Cooper II

After reviewing the proposed plan I have several comments that I would like to make regarding the extreme measures of restrictions being considered at Cape Hatteras National Seashore Recreation Area (CHNSRA). No other NPS seashore has ever had such extreme resource protection measures in place and the delicate balance between protection and accessibility has been kept in those instances. For your reference, Padre Island National Seashore (PAIS) founded September 28, 1962 is strikingly similar to CHNSRA both in geographic and wildlife make up. What PAIS does not have are total beach closures because of resource protection areas, enormous buffer zones. They have turtles that nest in the park just like CHNSRA. They have about 380 species of birds that have been observed there, this is approximately 45% of all bird species documented in North America. Included in that list is the Piping plover (10% of the world's population @ PAIS), Least Terns (8% of the North American population @PAIS), and the endangered Snowy Plover that call Padre their home -- at least for part of the year. This is because of the island's location on the central flyway, a major migratory route between the northern and southern habitats. CHNSRA bird populations pale in comparison to those numbers. Yet somehow the measures in place at PAIS are able to sufficiently strike a balance between humans and nature. The proposed plan for CHNSRA is overly restrictive for an insignificant percentage of the total population of wildlife that it is intended to protect. Addressing the proposed plan in its entirety, my request is that the CHNSRA final plan be modeled closely after the plan already in place at Padre Island for these many years. The PAIS plan strikes a fine balance between resource/wildlife protection and access to the resource(s) and there is no reason the very same plan would not work equally well at CHNSRA if not better.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more

balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

It would be heart breaking to see such beautiful creatures disappear, & become extinct. Please protect these precious, innocent, creatures from an uncertain fate. Such beauty, & innocence must always have a safe haven here on our beautiful planet.

Thank you.

Sincerely, Ruth M. Leibowitz New Jersey

Although I still have hopes of being able to retire to my home here on the Outer Banks one day, I feel the recent actions involving NPS, Audubon, the Consent Decree and now the DEIS render those hopes uncertain as to exactly what that retirement will be like. I had anticipated the recreational paradise with open beaches that I had encountered when I decided to purchase property here. This Spring, as has been the case for the last several April/May periods, these beaches have been arbitrarily closed to me as I just experienced this past Wednesday for example the Hook area with 45 open only as a cul-de-sac for .3 miles and the approach from 49 roped off. Since the water on the northern beaches was still too cold, I was left with fishing a completely flattened section off 49 with no drop-offs or holes to speak of. Granted the only importance to me was my day off for fishing. I did not stand to lose income or a job over my loss but my frustrations of that afternoon certainly raises the specter of losing my retirement to a mindset that has dreamed up Alternative F with 1000 meter buffers, no corridor bypasses, and treating non-endangered species as if they were officially endangered. I have been following these events now ever since the Consent Decree and recently attended the DEIS comment meeting this past Monday at the High School where I heard many well-spoken local folks with much more to lose than myself express their dismay over a proposal which would be more restrictive than the already unacceptable NPS bias against ORV access. That bias certainly has harmed, and if made permanent, will further damage the local economy. Without question, the elderly and the disabled will have been prevented from beach access. It appears to me that NPS has lost its way. This area was promised to be a recreational area for people to enjoy yet NPS seems determined to create another wildlife refuge. Please reconsider your priorities in these matters. I believe the position paper published by the Coalition for Beach Access is far superior to Alternative F, and if implemented, should allow co-existence for all parties in this matter, including the Plover. Thank you.

These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

0009418

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

I have seen what unregulated ATV/ORV management can do to a park. I no longer can visit a park in my town due to damage caused by irresponsible riders and lax enforcement. It's not a big area, but I did like to take my dog their for walks. And now it is full of muddy ruts from ATV usage and often is polluted by the smell of gasoline. A small group of pleasure seekers should not decide the fate of such an area, I encourage you to enact measures to ensure the protection of local wildlife, so that future generations my enjoy the area responsibly.

Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. **Correspondence:** Of the 45 people providing comments at the public hearing held in Hampton Va. last night, only two supported beach closure. One of those,suggested she supported beach closures so that she would be able to see the birds and turtles for years? I'm not sure she understood what a beach closure means.

The other had spent much of his life researching the Piping Plover but still offered no scientific data as to how the presence of humans endangered the Plover. The biggest danger to the birds and turtles appears to be ocean overwash and natural predators, not people.

My family and friends have been regular visitors to Cape Hatteras for the last 35 years. Hatteras is the place we go to surf, fish, enjoy the beach and escape the city. When we leave, we leave the beach just as we found it. This is place my children have learned to appreciate nature and protect the environment.

My interest aside, an economy and more importantly a culture should not be destroyed by the NPS at the request of few high powered, big business special interest groups. The coastline and national parks of the United States belongs to it's citizens. It's the National Park Services responsibility to protect our parks so that we may enjoy them, not deny us access to them. I support full beach access.

I would like to enjoy the beauty of this area, but since I would be on foot, this area is not for me unless I have rights at least equal to those with vehicles. We need to do all we can to protect endangered species: this does NOT include ORV's.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I am concerned that all of the aspects of this issue(Hatteras access/impact on wildlife) aren't being addressed. As a life long vacationer to the area, this would drastically impact my ability and cost to visit the area, as the changes being made would limit access. I want to be able to raise my kids to visit the OBX and enjoy the area, as well as open a business in the area, both of which I may not do if this passes. I respect the protection of this area, but I don't think it should come at the cost of the people who live and love the area.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** Hi! My name is Paul Rudar I am A self taught naturalist.I am 56 years old.I have spent most of my off time studying Animals birds,and fish, of all sorts.I have traveled from northern Canada to southern Florida doing this.I have spent countless hours at the OBX of NC.Since my youth I have seen too many cases of habitat destruction to valuable lands used by wildlife and fish.I was always amazed how the birds adapted to ORV use at the Cape Hatteras Recreational Seashore.Even more amazing was how habitat was created for the birds on the dredge islands.They prosper there with very little predation.In short what I am trying to tell you there is no sound science that over the years ORV use caused harm to any of the native nesting birds there.The interim MGT. plan was a good one and should be reinstated.My opinion is there are no good options in the DEIS NONE.The NPS is being bullied by A very small group SELC, DOW, and Audubon.Which in reality could care less about birds or the people of Hatteras island.They do nothing to suggest alternate ways to create habitat.They spend no funds on habitat for anything anywhere.They make there money in the courts and that is the bottom line of this entire problem.The NPS is also in my opinion obligated to manage Cape Hatteras recreation area as the majority of the people want not the suing few.Please reinstate the interim management plan because it worked for many years.Also please consider the loss of money spent for the local population to prosper. Since the consent decree My family has not spent much time enjoying our favorite seashore.Thank You! God Bless You Paul R. Rudar

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

**Correspondence:** Please do not close the beaches to Off Road Vehicles. I love going down to The Outer Banks for the reason, that I can drive right up to the beach and enjoy having my vehicles amenities right next to me. I can appreciate the interest in preserving the wildlife, but I do believe that it can be accomplished without having to close the beaches to Off Road Vehicles. Thank you  
J.A.

Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. **Correspondence:** I've been driving on the beaches of Cape Hatteras since the Hurbert Bonner bridge was built. Over the years I've seen more and more restrictions placed on people's use of the beach. Some of these are needed but many are not. Most of the pressure now being put on the NPS to future restrict the use of the

beaches is by outside influence who know nothing of the actual goings on at Hatteras. They have their own agenda and it has nothing to do with real facts and life on the Outer Banks. Let the local people decide what is best for THIER ISLAND and way of life. The respect the land/sea and would do nothing to harm either. thanks, Dick Gray

Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
I have the good fortune to live very near several National Monuments as well as one of the jewels in the crown of the NPS system - the Gran Canyon. Maintaining a healthy environment for all visitors as well as the flora and fauna is extremely important to me.  
I would therefore like to record my support the "environmentally preferred" Alternative D for the Cape Hatteras National Seashore. Watching the looming devastation of so many other coastal regions of our nation right now has broken my heart and makes me fear for the future. The birds, turtles, and other animals that rely on our fragile coastal systems need to be protected from uses that endanger them. As someone who uses the NPS a great deal, I believe that Alternative D will afford them that protection as well as make the area even more enjoyable and accessible to the maximum number of citizens and visitors.  
Thank you for this opportunity to comment.  
Regards

This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

- \*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.
- \* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.
- \* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

Surely we must be able to accommodate species other than the human. After all, even if we consider only our own species' welfare, without our fellow beings, the human experience would be far, far poorer.

Please do all possible to limit, even forbid, all ORV uses of beaches & other wildlife habitats.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

- \*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

The wild areas of our country should remain intact as much as possible! This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
 This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

**Correspondence:** To Whom It May Concern-  
I've been going to the Outer Banks for the past 35+ years, ever since my Grandfather purchased one of the first properties in Brigands Bay (Frisco). One of the great joys we always had was driving on the beach to go fishing. I loved it so much that I bought my own place there 3 years ago, only 2 streets over from his. Since then, I've taken my young family on the beach many times. We love doing exactly what I've done for 30+ years and I had hoped of passing along the great times I've learned to my children. It's been wonderful.  
But now that's changing... The idea of regulating ORVs on the beach is mysterious to me. It can only come from people who haven't been to the OBX and simply don't understand the history of generations that have lived and visited for this very right. We all love nature and intend to protect wildlife but to restrict ORV's like those that are proposed makes no sense to me. Personally, if I didn't care so much about wildlife, I would most likely be vacationing somewhere other than the OBX each year.  
In fact, the Bonner Bridge has taken forever to build because of all the bickering about wildlife protection. The bridge is so bad that I'm now feeling at risk every time I take my family across it. We joke about holding our breath as we travel over it and then I look down to see hardly any ORVs below. Nobody is fishing, nobody is hanging out enjoying nature. All I see are white picket signs everywhere- those that say you can't drive. It's a double reminder of how uninformed special interest groups can ruin so many good things in life.  
So.....I've decided to sell the cottage I love this Summer. While I love going to the OBX, it's not what I know anymore. Yes, I can still enjoy the beach but I can't drive where I want, I can't take my family out to a secluded area, I can't get away like I used to. It's not the same.  
Again, to special interest groups who don't vacation there...you'll have no idea what impacts you're having to the local economy and to those who have been diehard fans of the OBX.  
I'M ABSOLUTELY POSITIVE YOU WON'T LISTEN TO A THING I'VE WRITTEN, BUT I FEEL LIKE I AT LEAST OWE A LETTER, A COMMENT... HENCE THE NOTE.  
Sincerely, Craig Williams, former 35+ year visitor to the OBX

These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

 \* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
 \* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
 We are stewards of this planet, and have a responsibility to protect all life within it. I enjoy few things more than seeing wildlife in their native habitat, and most Americans agree.  
 Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
 As a person who not only loves to walk on beaches, the main reason I do this is to watch wildlife and especially birds.  
 This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
 The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
 \*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
 \* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. **Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

We have enough environmental disasters to worry about with the blowout in the Gulf right now. How about we get something done right and prohibit more beaches from ORVs? ORVs use gas (which is going to be in shorter supply until we cap the rig), and Americans need to get more exercise anyway.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

- \*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. I visited Cape Hatteras many times as a child, it was quiet and pristine. No National Seashore, from Cape cod to Georgia, should allow any machine. I had no idea that off road vehicles were even allowed. Some people care nothing for others or the planet . Please manage ORV off public land.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
For too many years, the interests of ORV groups, which represent just a small, but very vocal, percentage of Cape Hatteras visitors, have outweighed the interests of the two million people that visit this dynamic seashore every year. Please protect our ever increasingly threatened habitats for endangered sea birds and turtles.

**Correspondence:** I think I was 10 when I first vacationed on Hatteras Island. For years, we stayed at the hotel at the Rodanthe Pier. I have amazing memories of swimming, surfing, long beach walks, and catching fish from the beach. Thirty years later, my family now has a house in Frisco that borders the Cape Hatteras National Seashore. Three generations of three different families come from as far away as Japan to do the very same thing ? swim, walk on the beaches, catch fish, enjoy all that Hatteras has to offer. My children love it as much as I did. Please consider a balanced approach to managing Cape Hatteras National Seashore. Severe pedestrian and vehicle restrictions will dramatically and negatively affect the flavor of the area.

consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

**Correspondence Type:** Web Form  
**Correspondence:** To whom it may concern: It is my opinion that the beaches of the North Carolina Outer Banks be left open to vehicular access for numerous reasons. The North Carolina Beach Buggy Association has a good reputation for being good stewards of the beaches and most of us who vacation there are members. If not for open beaches to drive on, I like many others would cease going to the Outer Banks. I enjoy fishing, relaxing, and spending the time with family and friends while parked on the beach. I also pick up trash that blows by and do not harm any wildlife, except maybe a fish or two. If the beaches are closed to vehicles it will just be another thing the government will have taken away from its citizens to pander to the special interest of a select few. If you wonder why the American people are so fed up with federal government this is just another thing to consider.  
PLEASE keep the beaches open to off road vehicles to sustain your local economy and to allow the people who enjoy it to continue to have a fairly cheap pastime in this lousy economy.  
sincerely  
Lucas Wigfield

**Correspondence Type:** Web Form  
**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me. I grew up in Virginia and fondly remember trips to the Outer Banks. I now live in Massachusetts, and I am struck by how well Piping Plovers are doing on the Massachusetts Cape and how poorly they are recovering on the Outer Banks. One of the main reasons for the difference is the unrestricted access to the beach that ORVs have in North Carolina. To preserve the natural beauty for my children when I return to Virginia and North Carolina with my children, I would ask you to consider the following proposal.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

I have had the opportunity to see the Outer Banks seashore, it is an amazing and beautiful place and needs to be protected for future generations. Come on people-driving on the beach should be prohibited completely-it's just simply not necessary. The ignorant people who wish to continue this activity obviously have no care for anything but themselves.

**Correspondence:** I am strongly opposed to the closures proposed in pages 97 -101 of the DEIS. For example my family has enjoyed the Hatteras Point for generations for such activities as fishing both commercial and recreational picnics and other family outings. Traditionally many families would load up all the kids, pack them in cars, take them to Hatteras Point where the group would catch crabs and fish and cook them on open fires, spending the whole day in a great whole sun environment. A lot of family values were taught and learned at Hatteras Inlet. Myself and many others of my generation learned to drive on the flats that were there then. Hatteras Inlet has always been a place where families could go and enjoy a nice day at the beach. There is no reason people, birds and turtles can't all enjoy the traditional uses of this area as they have for generations. Protecting the Plover nest does not demand the entire Point, Hatteras or Buxton be closed. The number Plovers killed over the years prove this. Of the 26 birds killed, 23 were by the NPS. I am also strongly opposed the restrictions proposed on page 136 of the DEIS as to animals on the beach. My wife and I walk our dogs, on leashes, on the beach, as do many other people, for exercise every day. No dog on a leashes is going to disturb any nesting bird or turtle. Much of our income comes from summer rentals and now about 30% for the cottage rentals are dog friendly. This of course means that many vacationers come with their pets to enjoy the beach. With the existing leash laws there is no problem. There is a ship wreck that is in our walk area that changes daily. Sometimes it is almost complete uncovered and a few days later all you can see are rusty iron spikes protruding out of the sand. It is amazing and wonderful to watch what nature does to our beach and this late 1800's shipwreck. This is part of our heritage and historical use of the beach with our children, our grandchildren and our pets too. It is essential this be maintained for it's traditional use now and for future generations.

**Correspondence:** Please keep Cape Hatteras open to vehicular traffic. The local businesses suffer when access is cut off, as do the many vacationers that pick Cape Hatteras National Seashore Recreation Area as their destination. When the park was established did it not say that the park would be for the enjoyment of all? That should include people.. with or without vehicles. The birds can be protected without closing off mammoth portions of beach. If people just drive through and area and don't get out to scare the birds off their nests... provide a vehicle access above or below the nesting area until the chicks actually hatch. Then a closure until they fledge seems reasonable. There are rules that can be enforced to help reduce stress on the birds..... ie. dogs off leash and pedestrians in nesting areas. Foot traffic should observe the same walking area as vehicles use. You would have to have a lot of time on your hands to go through the entire book presented ... most people don't have that kind of time and just want to be able to reasonably enjoy a fishing vacation with access to follow the fish. Thank you.

**Correspondence:** Access to public beaches should remain open. It is a simple treasure that multitudes of tax paying individuals enjoy. Keep this national treasure intact. Granted, driving a vehicle on the beach does require some "maintenance" but I feel it is well worth the expense. There is nothing like driving your children on the beach for the first time and watching their eyes open wide and their faces light up.  
Our efforts should be focused on the petroleum companies Exxon, and now BP to ensure that their off shore drilling does not destroy our beaches. We are all for protecting the birds and sea turtles and people who visit the beaches respect this important aspect. For those who do not throw them in jail and do not let them out.  
Keep them open!  
Respectfully,

**Correspondence:** I'm writing today to request your swift action and fervent support of [ HR-718 /S-1557 ], a bill regarding preservation of public access to the beaches of the Cape Hatteras National Seashore Recreational Area.  
The National Park Service has for decades done an exceptionally capable job of managing our nation's first National Seashore. A delicate balance exists between insuring and protecting public access and wildlife habitats. Management authority belongs in the hands of NPS. Passage of this bill restores that authority and with it that balance.  
There is no place quite like it yet both its past and future is in peril without your support. The currently imposed Consent Decree is based upon flawed science with no peer review and supported only by well funded special interests and experts without credential. Along with missing its goal entirely it succeeds in polarizing while ignoring balance and excluding the stakeholders. Recreational enjoyment of this rare national treasure and public access to all Americans is being denied. A local economy is being devastated and the historic fabric of a community woven over hundreds of years is threatened at additional expense to taxpayers.  
Recent National Park Service Resource Management Field Summary Reports confirm that the first full season of park management under the Consent Decree has had no measurable positive impact upon wildlife habitat in general, or bird and turtle nesting results specifically.  
The National Park Service has historically been the protector of the National Seashore's natural resources while promoting safety and minimizing conflicts among its various users. I urge you to return management authority of the park to those best qualified. In the interest of fairness and good common sense I ask for your vigorous unqualified support and immediate action. Thank You! Shelley Tidd

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the

alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** Hello,  
I would like to comment on the DEIS, for public access to the beaches via off-road vehicles. I have been visiting Cape Hatteras for 25+ years. The main draw for me was the fishing, and the fact that we could drive our trucks on the beach, in order to get close to the surf fishing.  
I visit the island at least once or twice a year, specifically for the fishing. Ever since this planning project, and the supposed protection of the birds, the road-blocks have seriously impaired the ability to reach the "point" via truck, which as you are probably aware, is one of the best fishing spots on the East Coast.  
I am against this entire situation, and wish that this project would be dismissed. While I understand the thoughts about preserving some of these bird species, they are much more in danger of natural predators, such as the thousands of wild Cats, and other animals on the island.  
Since I have visited the Island, I have noticed that the vast vast majority of people respect the beaches, and take their time to be on the look-out for any species that may be nesting, or walking on the beach. The one (1) time I noticed someone abusing the beaches, by speeding, I immediately reported the infraction, and I am confident that any angler would do the same.  
While I do not live there, I have made several friends that own businesses on the island, and I continuously hear how this project has severely impaired their business. Especially during these trying times, we need to direct more business to the locals, and not impede their ability to make a living, pay taxes, etc.  
I among other thousands of people, would like you to please consider ending this madness immediately!  
I thank you for your time, and consideration.  
Todd Diamante

**Correspondence:** There must be a balanced approach to the issue of beach access vs. habitat preservation. An extreme position in defense of either position does nothing but pour fuel on an already explosive topic. It appears that special interest (environmental) groups with enormous financial and political influence are holding sway at the expense of what is reasonable and just. The manner in which policies are being established and enforced causes it to appear as if there is an agenda already implemented whose goal, ( in the name of environmental preservation), is to destroy the economy and cultural heritage of Hatteras Island and families that have lived here for centuries. If this is true, may it be exposed, and all necessary adjustments and corrections occur in order for that which is 'fair and just' to prevail.

**Correspondence:** To Whom It May Concern:  
I am writing this letter as a mother of 4 children that has come to the Outer Banks since I was a small child from Pennsylvania. My family and I started out by camping in a pop up trailer at the state camp grounds and ended up as we got older renting a beach house.  
I have lived on the outer banks for 3 years and am still working for a local rental agency, even with me moving away. I have seen the happy faces of so many families, including mine, that look forward to their annual, semi-annual, monthly visit to the Outer Banks. The allure of surf fishing, shelling, and

the crystal clean waters is what makes us all get thru the year round work week. The week or long weekend that gets us thru would be taken away if the access to the point and driving on the beach is taken away. I know that I would not have been able to take my children, ages 14, 11 and two that are 4, if I wasn't able to access the beach with my vehicle. The items I need to actually get there and not worry that I forgot the umbrella, sun lotion, or the cooler, that is always too heavy to carry, is just one reason of many to consider what kind of impact it would have on the average family that fishes, shells, or just enjoys walking along the beach shore holding the hand of their loved ones. I also fish so getting all the items I would need for that would be down right impossible.

On all my visits and living there, I had not seen one person disobey the ropes that are up or purposely go towards any of the birds that are on the beach. I truly think that the people realize what a gift it is to be able to access beach and respect our boundaries that are already in place. This is what I believe you all do not give us credit for.

Thank you for listening to a mom that is concerned that when she get the chance to have grandchildren, that opportunity to vacation and sit on the beach at Cape Hatteras Recreational Seashore will not be something that will continue....

Sincerely,  
Gail L. Phillips

**Correspondence:** These beaches need to be protected!!! I feel it is the U.S. Dept. of Interior's job to do just that. This is a NATIONAL SEASHORE, not just a Hyde or Dare County local county beach. These beaches are to be preserved not only for the two hundred milion U.S. residents, but any legal alien of the world visiting this great nation. The 800 or so people who showed up at the recent public hearings have a right to their opinion but, I feel, are an insignificant minority when looking at the overall scope of this National Treasure. This recent phenomenon of SUV, AWD, and ORV'S needs to be put in check immediately. We know this from the occurence of over 2500 full sized vehicles on the beach on Ocracoke alone in a single day. If this trend continues, the consequence for wildlife and natural ecological beauty of this fragile ecosystem will be in jeopardy. There are approximatley 6640 miles of coast line on the mainland U.S. To preserve Cape Lookout through Cape Hatteras' 130 miles is a crucial responsibility of the Park Service. Please, I beg you to stop the driving on the beach.....NOW!!

**Correspondence:** I have been coming to Hatteras/Ocracoke for beach fishing in the fall for many years and it is the high point of my year. For this reason, continued access to the remote parts of the beaches is very important to me.  
Due to the remote locations of the beach relative to paved roads and the many miles of beach, ORV access is essential to allow the public to access the park's beaches, this is especially true for physically challenged people, young children, and older adults  
Many environmental impact studies have been done and each and every one has shown that driving on the beach (as it has been practiced at Hatteras for over 60 years) has caused no detectable damage to the environment.  
The NPS has maintained records of turtle nesting, hatching, and incidents in which turtle hatchlings were killed since 2000. On average, there are about 12,000 hatchlings per year. In no year have more than 4 turtle hatchlings been killed by an ORV, while pedestrians have killed as many as 17 in one year. As you may know turtles produce so many hatchlings because very few survive to adulthood - the vast majority are eaten (in the first few hours of their life) by shore birds and fish before they reach the relative safety of the deep water. Since records have been kept, out of 93,500 hatchlings, ORV's have killed a total of 7, pedestrians 23 - an insignificant number relative to natural predation, certainly not enough to stop allowing ORV's (or pedestrians) on the beach.  
The NPS has been actively closing parts of the beach to ORV's and pedestrians to prevent interference with the mating and breeding of shore birds. While the effects of the closures on actual bird population are hard to determine, it is easy to recognize the effects of raccoons, stray cats, and stray dogs that have moved into the area with the presence of the human population.  
There are several barrier islands that have no bridge access and no human populations. These islands are largely free from un-natural predators. Shore birds will naturally avoid the populated islands for the safety of these islands. Encouraging the return of breeding birds to hatteras is an admirable goal, but one that is unlikely to work as long as there is a bridge to the island. I support continuation of the current system of nesting closures, combined with better control of the predator populations to increase bird breeding on the island. I would also point out that there are many hundreds of miles of beach nearby but outside of the national park where absolutely no ORV access is permitted, surely the 70 miles of beach in the park where ORV access is permitted cannot be responsible for a significant impact on bird breeding regardless of the management plan that is used.  
The new plan would eliminate all beach driving on Ocracoke island in favor of building a new road across the dunes closer to the beach to improve pedestrian access. The road construction project will create a much larger impact on the environment than the current ORV access on the beach. The road will impact the fragile dune environment and its vegetation and animal population instead of the stable and relatively barren beach zone. Birds crossing the new road are likely to be hit by vehicles traveling at a significant speed. Speed control on the new road will require constant and active enforcement, requiring the hiring of officers to enforce it. The sand provides constant passive speed control at no cost to the taxpayer - you just can't drive fast on sand even if you want to.  
It is my opinion the most logical solution to managing ORV access is to make the current management system permanent. This has the lowest environmental impact, lowest cost, and by far the widest public support.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me. I have noticed that ORV's and nature don't seem to mix well, and as our natural places disappear this type of activity becomes less and less viable.

Please support Alternative D when deciding which NPS plan will be used to manage ORV use at Cap Hatteras.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors.

\* Put Natural Resources First.

\* Establish clear goals for wildlife recovery.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

Our National Parks do not belong to any small group of individuals, but rather to all of us and future generations too. These wild places need our collective protection to ensure they will exist for all generations to come. The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. **Correspondence:** I feel that your policy of removing certain mammals (dead or alive) from the park to protect birds is a blatant double standard. The area around the pond near Cape Point should be removed of vegetation to give the birds room to nest and move around. This would help them and give them an area away from the beach to do their activities.  
 A parking lot nearby ramp 44 should be constructed along with some observation towers so the bird lovers could access and observe easier from an elevated platform for better vision.  
 A tractor and a cutharrow could do this job easily and economically.

Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

**Name:** Westervelt, Frederic B  
**Received:** May,01,2010 09:39:20  
**Correspondence Type:** Web Form  
**Correspondence:** The third paragraph of the DEIS Section "Socioeconomic Impact", page 561, reads as follows:  
"The total impact of the proposed alternatives would depend on the response of the affected individuals and businesses to the changes brought about by the proposed rule. To the extent that local businesses can provide alternate products and services, they may be able to reduce the impact on their profits. In addition, the effect of the alternatives would depend on the willingness and ability of individuals to visit substitute sites for recreation and of businesses to adapt to the available opportunities and changes in visitor use patterns under whatever alternative is selected. If individuals visit other sites outside the Seashore, then these regions would experience an increase in business while businesses in the ROI would experience a decrease."  
This haughty, imperious and diffident attitude of NPS toward the travails of Outer Banks residents and businesses is not merely unbecoming, it is offensive. From our perspective this paragraph should read:  
"The total impact of the proposed alternatives would depend on the response of the affected birds and turtles to the changes brought about by the proposed rule. To the extent that local wildlife can find alternative breeding, nesting and hatching grounds, they may be able to reduce the impact on their survival (cf. Darwin, Charles: On the Origin of Species by Means of Natural Selection or The Preservation of Favoured Races in the Struggle for Life, 1859). In addition, the effect of the alternatives would depend on the willingness and ability of the individuals to visit substitute sites for their biologic needs and of the species to adapt to the available opportunities and changes in hospitable habitat under whichever alternative is selected. If individuals visit other sites outside the Seashore, then these regions would experience an increase in population while the population in the ROI would

experience a decrease (Darwin: op. cit.)."

This is, indeed, what appears to be occurring. As depicted in Table 14, page 186, plovers are flourishing in Maryland, Virginia and North Carolina generally, whereas in CAHA (Fig. 3, page 187) the population is stable and near-negligible. Were Pea Island and the several spoil islands included in the census this point might well be more conspicuous.

In conclusion, I maintain that people are more important than birds, especially when the birds, being more mobile, are doing quite well.

**Correspondence:** I have loved the Outer Banks of North Carolina since my first visit there in 1968. In the past, I have visited all of the towns from Duck southward to Ocracoke, rented properties there, fished, flown kites, visited people, chartered boats, and generally learned about the islands and their people. It is a unique place. However, the Consent Decree has changed the area markedly. The Park Service seems to overlook the heritage of the people who live and work there, as well as it's own promises to those people when it presents plans such as "F" for the long term. It is much too restrictive. Others have listed, in great detail, just why. I agree with them completely.  
I once got onto the beach at Ocracoke with my old Jeep Gladiator, stuffed it into second gear, and let it idle from the south point all the way to the ferry with the wind blowing through the open windows, the sound of the waves crashing onto the shore, and the smell of the clean salt air in my nose. I took the ferry over to Hatteras, got back onto the beach, and repeated the process all the way to Manteo. I think I had to get off the beach for short distances only three times during the trip. I will fondly remember that experience for the rest of my life. However, it cannot be repeated. Too many restrictions. I have not been back to the area since the Consent Decree went into effect. As a form of protest, I will not go back until restrictions are eased, if not lifted. I used to spend several thousands of dollars there every year. There are many people like me, who will not return until the Park Service recognizes that the word "Recreational" is the key word in the Cape Hatteras National Recreational Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

- \*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.
- \* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.
- \* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.
- \* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.
- \* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

- \*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

**Correspondence:** I am a property owner in Avon, NC 4 Wahoo Cr. have read the propopsed text. I amsurprised that it is based on flawed science and incorrect of incomplete data. Why human interventive protective actions are allowed in one instance and denied in another is baffeling? Why data on beach use in the norther shores is included in data on Hatteras island is a clear distortion. Why the economic impact on traditional villages life is so minimized is frightening. Thbe study and proposal and not scientific and need further expansion and review.

**Correspondence:** As an annual visitor to Hatteras, I would like to express my opposition to the further restriction of beach access. Each year my extended family drive over 10 hours to vacation in Hatteras. Hatteras beaches are so family oriented and are a HUGE draw for tourism. The local economy depends on tourism for its very survival! Each year we [tourists] pump our dollars into the local economy as we patronize local businesses. We rent homes and kayaks, take deep-sea fishing trips, shop in local mom and pop grocery stores, buy souvenirs from a variety of shops, dine in local restaurants, and buy seafood from local fishermen. We enjoy visits to local museums and other venues. We LOVE, LOVE, LOVE Hatteras!  
One of the main reasons we love Hatteras is the fact that we can drive to find a secluded spot on the beach to enjoy the sand and surf. We are ALWAYS respectful of the environment and avoid areas where birds are nesting or where turtle nests exist. We ALWAYS pack out what we packed in and don't engage in wreckless behavior.  
All of that would change for us if access to the beach areas is restricted. The atmosphere of our beloved fishing village of Hatteras would change forever. The characteristics that make it unique and separate it from other beach towns up and down the Eastern coast would be lost. We live less than a 6 hour drive to many other beach towns, but choose to make the 10 hour plus drive to Hatteras so that we can enjoy Hatteras beaches. Please don't allow that to be taken away from us.

Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** Hi Our families have been vacationing in Avon, Frisco and Hatteras though out the years. We especially enjoy the beach access in Hatteras, where we

enjoy a lazy day surf fishing and relaxing. Here in NJ vehicle beach access is limited year round do to the summer beach goers, with few exceptions like Island Beach State Park (south end) all year. We have lived here for over thirty years and we have never heard of any environmental issues concerning vehicle beach access. We stay off the dunes and do not disturb the environment. We also take out our own garbage. Our beaches a clean. The wildlife is flourishing, nesting sites are marked and respected. There is no need to close beach access anywhere. OBX doesn't come near of the population of beach goers that visit NJ beaches in the summer. The people that visit your beaches are educated have a good understanding, concerns on environmental issues. People just don't drive on beaches because they can. These people are fishermen, birdwatchers, beachcombers, outdoors people, etc. They enjoy the outdoors. Wildlife has existed with mankind from the beginning. God gave us all things to enjoy. Why would you take that away.  
Joe Klingner Forked River, NJ

<b>Correspondence:</b>	Most of us only get to use the "Park" a few days a year and the "rules" are made by folks who don't even live in N.C. Please, open up the beaches, all of them. Those birds thriving on the spoil islands and that can be proven, just go and look. The fisherman is a friend of the Park and it's creatures and we have for years, taken care of them. Keep it that way, NO MORE CLOSURES. KEEP THE BEACHES OPEN. Thank you for taking the time to read my comment. Ron Melton Winston Salem, NC

**Correspondence:** As a native North Carolinian and Hatteras Island resident for the past 10 years, I am constantly amazed by others that do not live here or visit here that have such power over individuals and their ability to live a quiet life. My husband and I both work. We pay our taxes and our bills on time. We are not free loaders of the system and we just want the ability to live our lives, enjoy the beach, fish occasionally and let our dogs play. We do not bother others. We do not bother other wildlife. But it seems there are others in the world that have it out for us and the other residence of Hatteras Island. From the inability to get a very dangerous bridge replaced to not allowing beaches to be visited, more and more it appears there is a larger plan to shut this island down. I am not sure why or who but this island cannot continue to remain with the onslaught of these individuals or businesses. It is with great emotion that I plea to everyone, we are people too. We deserve what we have worked very hard to obtain. We do not bother anyone else. We only ask that we be left to live our lives, love our beaches and enjoy the beauty that is Hatteras Island.

**Correspondence:** Dear Mike Murray, My husband and I have lived in Buxton for 36 years. We grow a garden, and have fed ourselves with the fish we catch. It is not possible to catch fish just anywhere, and The Point is our main fishing grounds. I disagree with the need for 1000 meter buffer around a plover nest. This makes it impossible to use even a narrow corridor to get to The Point. I think there is an easy solution to protecting the birds and allowing access, as the corridor we would be driving through is not suitable for the birds to be nesting on.

**Correspondence:** As I waded through the bulky information on the DEIS, it gradually dawned upon me that there was a fundamental flaw in the conventional thinking regarding beach access and usage within CAHA- which is that one size must fit all. I believe that we must not look upon our beaches as a Procrustean bed, forcing all to accommodate.  
Since formulating my letter of 18 April I have struggled with the utility (or lack thereof) of Alternative F, the choice of the NPS. As noted, I still find it arcane, fractious and overly complicated, possibly unenforceable at reasonable cost and unsatisfactory to the public.  
On the other hand, it may be that Alternative F will be necessary in such heavily populated areas as Hatteras Island and adjacent Nags Head, with its beach villages, popularity for surfing and the Cape Point lighthouse attraction.  
Ocracoke, meanwhile, is unburdened by beach villages, an ample beach to person ratio and relatively low wildlife concentration.  
In my opinion, this favors Alternative A as the most appropriate choice for Ocracoke Island. This plan is administratively simple to oversee and for public cooperation, and meets the needs of wildlife conservation.  
Please give serious consideration to this tailored approach to the issue of beach access- Alternative A for Ocracoke.

These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
Below is a form letter, although I'm sure you get plenty of these please consider the below ideas as my own.  
We need to do more to protect these critical nesting areas for birds. I have been on many beaches and seen first hand the destruction that cards, bikes, and other ORV's can have on shoreline habitat.  
Although any human use will have some impact on the shoreline nesting bird species, pedestrian use and properly marked walking areas or man made paths would help to reduce the impact on the sandline/grass areas that these birds require.  
Please consider the following recommendations as my own.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. **Correspondence:** I first visited Cape Hatteras when I was in college and fell in love with the beautiful beaches & friendly people. I longed to return and finally did with my family. We have been staying in Avon for many years and absolutely LOVE it. We enjoy driving out and spending our day at Cape Hatteras Point. The beauty, peace, friendly people, quiet, and unspoiled beaches are what we go for. Being able to drive out to the beach is what makes our vacation so very special. I have always seen everyone take their trash with them and are respectful of the beach and wildlife. We have rarely seen anything left behind. If we do we pick it up ourselves. I've seen more trash and burned firewood on the beaches we can walk to from our rental home. Being able to drive out to the beach and sit all day is pure delight and should remain that way for generations to come. That's what makes Hatteras so VERY special.

**Correspondence:** God put the beaches on the earth for humans. We get #1 priority. Birds need consideration but only after the people. It is crazy to think we have to tiptoe around the birds. We are the important beings on this earth. It is bad enough that you need a liscense to fish the ocean, now we won't be able to look at it. Are the birds going to bring in revenue for North Carolina, I doubt it. God created the earth and sky, then the animals and finally man, to enjoy his work.

**Correspondence:** My family has been going to the Outer Banks for more then 40 years, I took my first steps on Cape Point 37 years ago and was fortunate enough to let my son do the same 7 years ago. Fisherman have made Cape Hatteras what it is today and without them it will fade away to nothing. Every business and every resident lively hood depends on beaches being open for people like us to come to. When the land was turned over the National Park Service it was promised that the beaches would always be, but you have broken that promise. Over the last few years you have failed to remember who you work for and serve, it's not the Special Interest Groups, it's the tax payers. From all the DEIS meeting that as occurred over the last few weeks 3/4 of the majority was Fisherman. Where was the ones wanting the beaches closed, where was the great multitude of environmentalist. Their was none! If they do not care enough about voicing there opinions on what they want, then why do you continue to favor them. Well the majority has spoke and you can't hide or cover your ears from what we have said, we want our beach back. The fishing community is the real environmentalist of Cape Hatteras. We all have provided you with excellent input on what it would take to preserve this special place and you have failed to listen to any of it. It's a shame that you have turned you turned your back on a community that has supported NPS all these years.

**Correspondence:** : When Congress established Cape Hatteras National Seashore Recreation Area in 1937, its intent was to permanently provide for all Americans a unique area for their enjoyment and use.

For years now, those of us who utilize this unique resource have been under assault by a variety of environmental special interest groups that would deny us, but not themselves, access. And, in each case where evidence was heard from both sides in the court, they were sent packing. Quite simply, their claims were refuted by sound science and law. All of this has been at the expense of the American taxpayer. What occurred April 30 in U.S. District Judge Terrence Boyle's court in Raleigh changed everything.

It's the piping plover that has become the "poster child" for these groups. The plover is a relative newcomer to CHNSRA. Every bird study conducted between 1900 and 1959 shows that it was not until 1960 that the first birds arrived in the park. Plovers nest independently of one another and not in colonies. They neither feed nor care for their young from the moment they hatch. They nest in areas that are subject to frequent overwash and frequently lose nests as a result. This has already occurred at CHNSRA in the 2008 breeding season, and not just with plovers. Predation has also taken its toll this year.

The piping plovers that nest at CHNSRA are part of the Atlantic breeding population, which is considered "threatened," not endangered. It is very important to understand that CHNSRA is on the extreme southern edge of the plovers' breeding range, which accounts for the historically low numbers within the park. Most plovers nest well north of Cape Hatteras, from Virginia's Eastern Shore to Newfoundland, Canada -- with the majority of nesting occurring mid-range.

I am an individual who has utilized this resource, this national seashore recreation area, for almost three decades. And like many, I am so familiar with this beach system that predicting structure changes, overwash, and the like comes as second nature. Collectively, we possess more first hand knowledge of the workings of the beaches and the wildlife at CHNSRA than any environmental group in existence. It is, therefore, no surprise that an Alberta, Canada, plover study contains the following statement: "Human presence in an area can be a very effective form of predator deterrence." (U.S. Fish and Wildlife Service, 2000) Interesting as well is a statement by Tim Gallagher editor-in-chief of Living Bird magazine, published in the spring 2000 edition, "But the large number of people always present at beaches does have a remarkable taming effect on birds." This reflects what we see daily as we visit our cherished beaches.

There are 21 documented ORV related plover deaths in the entire United States. Twenty of these were committed by federal vehicles. In the 47 years prior to the consent decree, not one single plover death can be attributed to an ORV user in this park. One hundred percent of plover mortality at CHNSRA has been a result of either storms or predation. That is a far cry from the 24 piping plover nests the Army Corps of Engineers destroyed recently in the name of floating two barges of alfalfa pellets down a tributary of the Missouri River.

The Defenders of Wildlife, National Audubon Society, and the Southern Environmental Law Center would have one believe that none of what I write in these pages is true, though it's all in the public record.

The consent decree deals also with other birds, such as black skimmers, common terns, least terns, bull-billed terns, Wilson's plovers, and American oystercatchers. None of these birds are threatened or endangered under the U.S. Endangered Species Act. The consent decree treats them as though they are and at additional taxpayer expense. It also deals with the variety of sea turtles that occasionally nest on the park's beaches, now requiring full beach closures unlike the National Park Service's Interim Strategy.

Some "inconvenient truths" for DOW, Audubon and SELC include the fact that under the Interim Strategy (IMS), the 2007 nesting season was the most successful piping plover breeding season in over 20 years. Currently, under the consent decree, a single plover chick is given enough beach area to cover the decks of three U.S. Navy super aircraft carriers, the largest warships on earth. In most American communities, a convicted child molester can live closer to a public school than a fisherman and his family can get to a plover.

On a positive note, the Atlantic piping plover population is fast approaching 2,000 nesting pairs -- a figure that makes them eligible for de-listing as threatened. The most recent counts show 1,700 nesting pairs. Just four years ago, the most accurate estimate was 1,400 pairs. This represents a rather dramatic increase in breeding pairs in a very short period. Unfortunately, at the cost of even more taxpayer dollars, de-listing the Atlantic plover population is probably going to be challenged in court.

The environmental groups also claim a substantial drop in black skimmer and gull-billed tern numbers. What they don't want you to know is that the bird count for the 2007 season shows a better than 20 percent increase in numbers. They know very well that the birds chose to nest on a newly recreated dredge spoil island within sight of the park because Walker Golder of North Carolina Audubon and also a plaintiff and member of the negotiated rulemaking committee, participated in the study. In reference to this habitat, named Cora June Island, the North Carolina Wildlife Resource Commission writes:

"An outstanding success story can be found on Cora June Island, located near Hatteras Inlet. This island disappeared during Hurricane Isabel in 2003 but was rebuilt in spring 2007 during a dredging project by the U.S. Army Corps of Engineers. Only months after rising from the sea, the island was home to one of the largest mixed tern/black skimmer colonies in the state with good numbers of nesting adults that successfully fledged hundreds of chicks.

"The recent survey, which was conducted in spring 2007, is one of 10 complete coastwide surveys conducted since the late 1970s to monitor population trends, distribution of colony sites, and nesting habitat conditions. Data gleaned from the surveys help biologists make management and conservation decisions and prioritize research. The next waterbird survey is scheduled for 2010."

They would prefer you to believe that night driving on the beaches at CHNSRA disorients sea turtles. Hence, the ban imposed by the consent decree. But they would have you ignore Pea Island National Wildlife Refuge, the northern 22 miles of beach on Hatteras Island. At Pea Island, there is no beach driving and fewer than a dozen lights visible from the sea. Very few pedestrians frequent these beaches because of the difficulty in accessing them. And yet Pea Island has no greater turtle nesting success than ORV accessible beaches but does have more false crawls and aborted nesting attempts, than the open beaches. They would also have you ignore the fact that plovers don't nest there in spite of the excellent conditions.

Under the Consent Decree, if a turtle nests within the relatively minute portion of beach that's still accessible by ORV, the Park Service is required to establish virtually the same nest enclosure as established within the interim strategy. Beach users may drive by, park by, and fish by this clearly marked 10 foot-by-10 foot cloth revetment at will -- until Sept. 15. On that date, the consent decree imposes full beach closures in addition to the procedures outlined in the interim strategy, making those areas impassable by vehicle or pedestrian. This is absurd and arbitrary. The consent decree clearly states that if a nest is approaching its anticipated hatch date (pre-Sept. 15) NPS is to follow the same procedures outlined in the IMS, not including full beach closures, which means that in spite of the additional "path" NPS constructs to funnel the hatchlings to the sea, the beach immediately outside this small closure is still accessible to both pedestrian and ORV use. So why is Sept. 15, the "magic" day? Because this is an arbitrary date by which perhaps some of the bird closures will have been reduced and the consent decree finally allows for "permitted" night driving. This is a thinly veiled maneuver to continue to prevent ORV access to the beach. If it was okay for me to drive by or park and fish right next the closure on Sept. 14, it should be just fine on Sept. 15.

The environmental groups don't want you to know that at the best of times ORV users can only access less than 30 percent of the beaches at CHNSRA and that their "12 percent of the beaches affected" figure assumes 100 percent ORV access. This has not been true for many, many years. The truth is that well over 90 percent of the beach is currently closed either directly or by default. Areas bounded on both sides by closures are inaccessible even though they are technically open. The groups prefer to focus on ORVs, but the current closures prohibit pedestrian use as well. No entry means just that. It is, I think, ironic that as I labor over this communication, The Defenders of Wildlife have just sent their members an e-mail dated June 15, 2008, that describes success as a result of the consent decree. "Since some of the most sensitive areas were closed to vehicles, birds like the piping plover and the American oystercatcher have been bouncing back."

Plover numbers are the same as they were last year under the interim strategy.

And, according to the most recent available NPS resource management field report, American oystercatcher numbers were better last year under the interim strategy than they are this year under the consent decree. At this point in time last year, American oystercatchers had attempted 41 nests and had 17 active or hatched nests. At this point in 2008, they have attempted 33 nests but have only 16 active or hatched nests. With the extensive closures, this can in no way be blamed on ORV drivers. This completely refutes the claims of the aforementioned environmental groups' press releases that the American oystercatcher is somehow miraculously "bouncing back" as a result of greatly restricted ORV traffic.

The e-mail also states:

"The emergency plan was developed to be flexible, with temporary closures that can be lifted and reopened to vehicles once wildlife is no longer using certain areas. Already, some areas have been reopened this season."

This ignores the rash of immediate closures that followed the April 30 signing of the consent decree. Because of the consent decree, anyone with a cell phone can call NPS, report bird activity, and the Park Service is required to close the area for weeks at a time. All of the areas that have been reopened

as of June 26 were initially closed because of inaccurate and perhaps false observation.

They would rather you didn't think of them as parties to the lawsuit that has prevented the replacement of the Bonner Bridge, Hatteras and Ocracoke islands' lifeline and only over-ground hurricane evacuation route -- a bridge with a safety rating of 4 out of 100. The bridge in Minnesota that collapsed in 2007, killing many, was rated at 27. Since when do we so blatantly condone risking the loss of human life? The environmental groups have already announced that if the new bridge is attempted as planned, they will sue.

The consent decree is an obvious attempt at changing a national seashore recreation area into a private wildlife refuge -- which has, so far, been successful at the cost of untold taxpayer dollars. Remember that the plaintiffs are consistently reimbursed their legal fees and expenses by the already strapped Park Service and Department of Interior. You must also consider the cost of constant monitoring, flying in and housing of unneeded special event teams, additional, extensive new signage, additional vehicles, law enforcement and infrastructure.

The impact of the consent decree on the economies of the villages bounded by the park has been astounding. I know this first hand because it has cost me my job at a business that is suffering economically. Conditions under the consent decree continue to fester as more Americans and foreign visitors discover that the experience they expected when they arrived at CHNSRA has been almost entirely compromised. Some have already cancelled their reservations or vowed not to return. And yet both the environmental groups and United States Fish and Wildlife Service continue to utilize the arguably inept Voglesong study as the foundation of their economic and visitor usage statements, in spite of a government-funded peer review that deems the study essentially worthless. The esteemed panel also regarded the data and its collection methods so flawed that further review of that data would be a waste of time.

The consent decree has changed the very nature of the Park. Though the environmental groups claim to want to preserve CHNSRA for future generations, I fail to see the value of a national park that remains largely inaccessible during the spring, summer, and fall, when the majority of Americans who visit the park take their vacations at this time. And if USFWS gets its way by declaring the seashore as critical wintering habitat for Great Lakes and Great Plains plover populations, though they openly admit they have no idea where the wintering birds originate, this will include the late fall and winter months as well.

Preservation has been, so far, successful without court intervention and a draconian consent decree. What choice did Dare and Hyde counties and the various beach access groups have other than to consent? It came down to either accepting an agreement that they had no voice in and hoping for the best or face certain closure and the enormous economic impact that it would spawn.

A federal judge is bound by law to render a fair decision based upon the merits of the evidence presented before the court. But Judge Boyle declared his intention to provide the environmental groups exactly what they sought without hearing any evidence from either point of view and precluded the intervening parties, Dare and Hyde counties and the Cape Hatteras Access Preservation Alliance, from entering any evidence at all in open court. This occurred within the first few minutes of a February scheduling conference in Boyle's court. At a later hearing, in spite of being charged by law to consider the economic impact of the proposed closures within the consent decree, Judge Boyle repeatedly declared his lack of knowledge and understanding of CHNSRA and the villages contained therein, and signed the decree anyway. His obsession with closing Ramp 4 (Bodie Island Spit) as related in the transcripts of the April hearing is baffling. (Available on Island Free Press Web site. Go to Beach Access Issues Page, go the end of that page, and click on archived stories.)

What the negotiations between the environmental groups and DOI promulgated can only honestly be referred to as a decree of forced consent.

CHNSRA was established first and foremost as a national seashore recreational area. This is blatantly obvious when one reads the enabling legislation formulating and forever establishing the park, which is dated Aug. 17, 1937. It provides in part: Sec. 4. Except for certain portions of the area, deemed to be especially adaptable for recreational uses, particularly swimming, boating, sailing, fishing, and other recreational activities of similar nature, which shall be developed for such uses as needed, the said area shall be permanently reserved as a primitive wilderness and no development of the project or plan for the convenience of visitors shall be undertaken which would be incompatible with the preservation of the unique flora and fauna or the physiographic conditions now prevailing in this area?

On June 11, 2008, U.S. Sens. Kay Hagen and Richard Burr and U.S. Rep. Walter B. Jones introduced bills S3113 and HR6233. These bills, if enacted, would put aside the consent decree and return CHNSRA to the management of the Park Service's interim plan. This would effectively take management decisions out of the hands of a few special interest groups and return it to the professional scientists and staff of NPS at a considerable savings to taxpayers over the life of the consent decree.

Already these groups assail the media and their members with tales of doom were these bills signed into law. Some claim that Congress has no business even dealing with this matter. I beg to differ. Congress established this park for the American people and provided us with a place we have fought hard to preserve as the unique and dynamic place that Hatteras is -- or was.

For years, most of us have lived by OBPA's motto, "Preserve, Protect, Not Prohibit." For example, to this day NPS does not employ "beach clean-up crews." We do this on our own time and at our own expense. This hardly represents a user group with a penchant for environmental abuse.

Congress reserved the right to change the nature of an established national park for itself. And so there is no question as to whether these bills should be co-sponsored and enacted.

16 U.S.C. Section 1a-1 states, "The authorization of activities shall be conducted in the light of the high public value and integrity of the National Park System and shall not be exercised in derogation of the values and purposes for which these various areas have been established, except as may have been or shall be directly and specifically provided by Congress."

Surely this applies to forced closures as that constitutes an activity as well. Non-government organizations have taken over scientific management of a national park under this consent decree, an activity not sanctioned by Congress.

I urge the National Park Service to do the right thing and provide access to this resource and stop being influenced by the eco terrorist

**Correspondence:** When Congress established Cape Hatteras National Seashore Recreation Area in 1937, its intent was to permanently provide for all Americans a unique area for their enjoyment and use.

For years now, those of us who utilize this unique resource have been under assault by a variety of environmental special interest groups that would deny us, but not themselves, access. And, in each case where evidence was heard from both sides in the court, they were sent packing. Quite simply, their claims were refuted by sound science and law. All of this has been at the expense of the American taxpayer. What occurred April 30 in U.S. District Judge Terrence Boyle's court in Raleigh changed everything.

It's the piping plover that has become the "poster child" for these groups. The plover is a relative newcomer to CHNSRA. Every bird study conducted between 1900 and 1959 shows that it was not until 1960 that the first birds arrived in the park. Plovers nest independently of one another and not in colonies. They neither feed nor care for their young from the moment they hatch. They nest in areas that are subject to frequent overwash and frequently lose nests as a result. This has already occurred at CHNSRA in the 2008 breeding season, and not just with plovers. Predation has also taken its toll this year.

The piping plovers that nest at CHNSRA are part of the Atlantic breeding population, which is considered "threatened," not endangered. It is very important to understand that CHNSRA is on the extreme southern edge of the plovers' breeding range, which accounts for the historically low numbers within the park. Most plovers nest well north of Cape Hatteras, from Virginia's Eastern Shore to Newfoundland, Canada -- with the majority of nesting occurring mid-range.

I am an individual who has utilized this resource, this national seashore recreation area, for almost three decades. And like many, I am so familiar with this beach system that predicting structure changes, overwash, and the like comes as second nature. **Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding,

migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

Dear Congressman: I am most concerned about the current crisis in our National Parks. I am sure you would agree that the parks were set-aside for all the citizens of this fine nation to enjoy, protect and preserve. My immediate concern is the current status of Cape Hatteras Recreation Area; this area is a beautiful piece of America that should be enjoyed by all Americans. At its inception this seashore was divided into distinct areas' meant to balance the mission of protection and preservation along with an area set aside for recreation. The people who established the park wisely set aside 13 mile long Pea Island National Wildlife Refuge to protect migratory and shore birds. The Cape Hatteras Recreation Area was meant for the people to enjoy, it was also touted to be a great economic engine which it has proven to be. A long tradition of surf fishing has been the main stay of this economy. When Congress created the Cape Hatteras National Seashore Recreational Area in 1953, only sand roads existed! Beach driving was and has always been a way of life here. At that time, land owned by many local residents was transferred to the Federal Government to be a part of the designated National Seashore. In the negotiations for this land, the United States Government promised the residents of Hatteras and Ocracoke who gave up their land, that traditional access, such as beach driving, would be honored. We do not have traditional beach accesses such as boardwalks and numerous large parking lots with easy paths to flat beaches. Our beaches are vast, remote and protected by sand dunes. We have designated ramps for four-wheel drive access. Beach driving is essential to accessing many of our beaches, especially for people who are elderly, infirmed or handicapped, and small children who cannot walk three miles in thick sand to see the famous Diamond Shoals or inlets. It is important to note also, that in order to clearly differentiate land as a wildlife refuge and land as recreational use area, Congress designated Cape Hatteras National Seashore as a Recreational Area. The clearly stated intent of Congress was to provide locals and vacationers an area to enjoy activities such as camping, surf fishing, boating, kiteboarding, surfing, beachcombing, etc. A small group of out-of-state environmentalists now want the government to break that promise and ban beach driving. Additionally, they want to usurp traditional recreational land, such as Cape Point, and designate it as wildlife refuge, restricting human access to the most famous surf-fishing spot on the East Coast. Already, over 85% of our island is protected by law against further development, so that the natural habitat may continue to flourish. Extreme environmentalists claim that a prohibition of beach driving will "save" the piping plover, which have been spotted infrequently on Cape Hatteras. In fact, from 1902-1960 no piping plover nests were ever spotted on Cape Hatteras. Since 1901, there have never been more than fifteen breeding pairs of piping plovers, ever, at one time, on the island. An abundance of feral cats, gulls, fox, and Mother Nature in the form of high storm and lunar tides, have resulted in unsuccessful nesting. Although the National Park Service does not have a formal beach driving management plan, they have an interim plan, and are developing a long-term plan so that a balance between recreational use and wildlife protection is upheld. Local residents, business owners, government representatives, sports enthusiasts, and also environmentalists have all been working with them to ensure that all interests are represented in the plan-making process. This is a federally commissioned group to ensure that a democratic process prevails and that recreational use and wildlife protection can exist in harmony. Unfortunately, extreme environmentalists have chosen to bypass the agreed upon democratic process, and now seek drastic action that will significantly and detrimentally impact local communities and vacationing families. Judge Terrence Boyle has been extremely bias and has inserted his own doctrine into this process and our National Park is being regulated by a judge rather than through a congressional process. I believe this to be unconstitutional. The current consent decree was not a compromise and is not fair. Please provide leadership that protects the wildlife and protects the people's rights to access their national parks. Remember many beaches in Cape Hatteras National Seashore And Recreational Area Can not be accessed without ORV. That's the Wonderful aspect of this beautiful place.

Sincerely,

I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the

alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I support open and accessible beaches for the Cape Hatteras National Seashore Recreational Area. Piping plover are not endangered and we as people

work to help the animal and wildlife. Why should they have more protection than people? Please help keep our beaches OPEN for the people, the economy and for all who care about this beautiful Outer Banks.  
Thank you!

**Correspondence:** Dear Sir,  
 I have been visiting Hatteras Island for 31 years. I love the Outer Banks so much that my husband and I chose to purchase property in Avon, NC. We have raised three children to have a love and a respect for these beautiful and fragile barrier islands. My mother, son, and myself are all handicapped. We love to come to the Hatteras Island to be able to drive on the beach to see the ocean. We are all unable to walk over the double sets of dunes to access the ocean. We support open public access to all beaches on Hatteras Island. By limiting access to 50% of the beaches on the Island is infringing on our ability to enjoy the ocean. We support allowing the National Park Service to act as caretakers of America's natural resources for the benefit of the AMERICAN PEOPLE. The birds and local wildlife are protected in land set aside for them both north and south of Hatteras Island. The Pea Island N.W.R. at the north end of Hatteras Island serves this purpose perfectly. It is for the birds and the WILDLIFE! The NATIONAL SEASHORE is for PEOPLE. The Shackleford Banks and Portsmouth Island to the south of Ocracoke are uninhabited islands completely accessible for wildlife. Please allow Hatteras Island to be used by the people for the benefit of ALL American people. The year round inhabitants of Hatteras Island are facing real economic hardship due to the poor economy AND the super-restrictive beach closures. The number of weekly rentals at our beach house has dropped by 50%. The Island needs to have the access to the point and the Ocracoke/Hatteras Inlet year round. Please restore access to all Hatteras Beaches year round. Please allow Humans to use all the beaches in the Cape Hatteras National Seashore. Let the birds have the "wildlife" areas, and let the people have the National Parks. Thank you,  
 Ruth Marotto A concerned citizen and taxpayer.

Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me. These areas, near where I was born are critical to the birds and other wildlife in these coastal areas that use them breeding, migration, or just plain live there year round. Enough damage has been done. I think Alternative D is okay, consider these thoughts in making a plan:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. **Correspondence:** I do not like the size of the bird closures. Much too large and restrictive. Smaller closure areas that protect nesting are more realistic. Alt f seems to be good except for being overly restrictive.  
Am also concerned that the maps I view showing beach open to driving are beaches where no one can truly drive. Like most of the beach north of Buxton to Avon. No way anyone could drive on that bad beach. It should be listed as inaccessible by nature and not counted as open beach.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me, and to the planet. There is NO reason why ORVs, which are loud, polluting and intrusive, should have access to the National Seashore. We all have a responsibility to protect and conserve our wildlife, wilderness areas, wildlife, seas and birds, and it is essential that we do so.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore. NO ORVs should be allowed - they cause far too much damage to our fragile environment, and should be prohibited.

**Correspondence:** I am contacting you regarding the environmental impact study for the ORV management plan for Cape Hatteras National Seashore and recreational Area. This plan is very much so influenced by the radical environmental lobby groups. I am deeply troubled and down right upset. As you may know, these radical groups only care about their own interests and do not care about making a fair compromise. We need you to take a stand for the people. This important issue is not just about driving on the beach. It is about accessing our favorite areas in the park. This radicalism is taking place all over the nation and access to our favorite national parks are being jeopardized. I and many other beach goers have personally volunteered many times in the park picking up trash that washed up from the ocean and other tasks that the rangers need help with. Not once have I ever seen anyone from the Defenders of Wildlife, The Southern Environmental Law Center or the Audubon helping out in the park. They just want to take away people's rights. We already have a 13-mile long wildlife refuge near Hatteras call Pea Island. Isn't this enough? The radical environmentalist are relentless and well funded, they will not stop suing until they have it all. We need your help now. I feel sorry for the next generation like my son who has a lifetime fishing license. He might not have the same opportunities that we have had.  
Sincerely,

---

**Correspondence:** The National Seashore was established to maintain public access to a national treasure. Special interest groups such as Audobon society should not be able to dictate what access is to be had on any stretch of public land. The endangered and/or protected bird species have faired worst this past year than before even with all the additional closures. There is no science in any of their claims. Their peer review articles are a joke. Most likely, predators do much more damage than ORV's do on the national seashore. Nature will find a way. ORV users on the national seashore are an asset in my opinion. We stop and pick up trash that may have been washed up by shipping waste, etc. We are good stewards of the land and leave it better than we found it. The national seashore should remain open to ORV access year round and along the entire stretch of shore it encompasses. Closures for nesting turtles are understood and I gladly abide by those closures. The bird closures are a different matter entirely. There is no science to support ORV restrictions to support the nesting habits of these birds. On the contrary, this past year has suggested otherwise. Maybe, just maybe, ORV's help keep the predators at bay and further away from these nesting birds. Just a thought. The economies, community spirit, and livelihoods of generations of locals along the stretches of our national treasure will be put at jeopardy with any more closures of our national treasure because folks like me who vacation here will no longer be allowed to buy bait from them, food from them, gas from them, etc.  
Sincerely, Chris Tart

**Correspondence:** I posted an earlier comment but left out 1 major point. Alternative F is entirely too restrictive and is not science based. Much of the plaintiffs side is bad science and to call it peer reviewed calls for serious ethical concerns. To call for more closures to ORV access, to close entire areas of the seashore year round to pedestrian and ORV access, to make the bird closures 100 meter buffer zones... all of that is way over the top and far too restrictive. I am entirely against Alternative F as it will further limit access for many who love to use our national treasure and will deter visitors and vacationers alike who use ORVs to access this wonderland. Alternative F needs to be redone if it is the NPS's preferred alternative because it is a stepping stone into more restrictions in the near future. If the plaintiffs had their way, the entire seashore would be closed based off of bad science and birds who are getting eaten by predators more so now than they were last year due to the limits that have been placed on ORV access.  
Sincerely,  
Chris Tart, PharmD

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me. At 62 years of age, I have been fortunate to have visited most of our parks. The very specialness of them is the unique wildlife each one shelters. We must preserve this precious wildlife in the parks while enjoying them.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

**Correspondence:** I believe that the arrangement between N.P.S. and locals has been very good over the years. Outside special interests are now being allowed to strike fear into the hearts of the leadership of the N.P.S. and our elected representatives. I wish that we had a decent attorney to fight this FOR local interests. The amount of beach area being closed is totally unnecessary when the actual number of nests, etc. is considered. Pre nesting areas are in and of themselves pointless. The birds that do nest here aren't going to be interested in a "reserved area" for them. The size of the areas being blocked off for EACH NEST is ludicrous to the extreme. Finally, it seems to me that things have been going quite well for all involved parties / species and that for reasons identifiable by the increase in tax free revenues for the Audubon Society and Friends of Wildlife, the publicity, (free), and notoriety garnered by using the ignorance of true facts by the people in general, we are losing our battle to retain the promise of a National Park system, and hold onto the belief that in America, the majority rules. Our politicians have their hands tied by an "appointed" judge and we cannot seek an IMPARTIAL jurist. My family, the Williamsons of Avon, still retain papers that state that the area from Little Kinnakeet to the present village was lent, by them, to the Coast Guard / N.P.S. I believe that as a last ditch effort, the original owners of the properties concerned should be allowed to revoke their agreements made in the past, as the groups holding these properties now have already made the promised use of the properties null and void.

**Correspondence:** TO those who may care, I have been visiting the outer banks for more than 10 years. Myself and my friends have spent one week in November and sometimes one week in May. We come to fish and enjoy the natural beautiful "National Seashore" that has been set aside for all to enjoy for eternity. We care about our natural resources. We are concerned for those people who take great care of us while we visit, from tackle shops to where we go to eat and buy souvenirs. We usually stay in the Avon area but have stayed in Ocracoke on occasion. This land belongs to all Americans to swim, fish, surf, walk horseback ride, to be available to experience. Take the responsibility to truly look at what the original intent of the national seashore and recreation for all citizens means. I am convinced the argument about endangered species and habitat is not being done in a true, honest, objective manner. I can't believe if the beach access is limited or closed altogether and for some reason off shore drilling takes place. The recent accident in the Gulf of Mexico is evidence that environmental disasters happen. Open the ramps, monitor the birds and turtles, use common sense.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** The outer banks is know for it's wind. It's know for the amazing beaches. It's know for the fishing. It's know for being a place of relaxation and fun. I have been coming to the outer banks since I was a young child. My mother has been coming to the outer banks since she was a young girl. My grandfather loved the outer banks. He is part of the outer banks. After he passed away and I went back to the outer banks for a kitesurfing trip. I could feel him there. I believe many other people like my grandfather have a connection to the outer banks like this. Stripping people for enjoying the beaches to the full potential is wrong. Everybody should enjoy them to the full potential. Not to mention the personal aspects of this but how is this going to affect the economy. I know that if the beach are closed to many recreational activities I will not travel to the outer banks. I would rather save my money and travel to another destination. I hope that you take this and the other comments into consideration and make the decision to allow all access to the beaches.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
Many years ago my family and I visited Cape Hatteras and greatly enjoyed the many birds and the wildlife we saw. For this reason I would support this alternative plan, which would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I do not agree - with the NPS recommended proposal represented by Option F. The proposal is to restrictive and doesn't acknowledge the current restrictions have been workable and successful. Bird and turtle populations have been rebounding for over 10 years. The more restrictive boundaries and limitations presented in the NPS preferred solution does not recognize the need for a vibrant livelihood for the residents of the Outer Banks. The limits which all have lived with for the last 2 years seem to have provided an acceptable balance. To be more restrictive ignores the human suffering that will occur with the more prescriptive limitations. As a disabled veteran and former Naval Officer - I have both sever limitations that do not allow me to walk to the shore and a love of the sea that draws me to the ocean. Please lets do something reasonable for the residents and guests - and given the current solution has been proven to be working for both, lets keep it.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** To Whom It Concerns:  
I need to offer my voice to clearly let it be known that I am profoundly opposed to greater regulations being applied to my home beaches on Hatteras Island, NC.

I see arbitrary, if not capricious, regulations being suggested that have no basis in science or preservation. That being said, I feel the Park Service could be creating some very expensive law suits in the future that could be avoided by rethinking the current pending policies.

All of the bird populations, treaties and laws, are currently being followed. There is no reason to extend the preservation policies.

Extending the Piping Plover buffets is arbitrary. Hatteras Island is the very tip of the their habitat and very few pairs produce chicks in this geographical location. There is no proof or reason to extend the current buffers.

Closing the tips of the island makes no sense as the birds have not been seen there, otherwise the tips of the island would have been closed years ago.

This is Park Service land and Park Service Employees are constantly looking for Piping Plovers, turtles, and migratory birds in order to close beaches. Permanent closure of these areas is arbitrary and capricious.

As a governmental agency, you represent all who use a park and park lands. Excluding people is in direct opposition to your fundamental purpose.

Excluding pets is just a way to perpetrate a mean attitude toward locals and visitors. Pets are leashed and fines are steep.

Driving on the Beach is not proven to upset the beach in any lasting form. The tire tracks evaporate in the wind and weather. There is no science proving that driving on the beach causes and ecological harm to the beach.

I am an environmentalist.

I believe in science and fairness.

Please rethink these policies. If you are not careful, you will ruin many people's lives.

The Hatteras beaches are for people and for wildlife.

Thank you.

Pam Bailey

**Correspondence Type:** Web Form  
**Correspondence:** I appreciate this comment time. We have been coming to Hatteras Island for over 30 years - in 1999 we became property owners on the island. Our first

house was on the beach side in Hatteras village and our current house is on the sound side in Indiantown, Frisco, NC. Our homes were both rentals. We had lots of guests who absolutely loved the area. I have saved all their comments about the area. One of the biggest drawing cards for our rental guests was location and the ability to drive on some of the most awesome beaches in the USA. Many fishermen and women come to Hatteras for that purpose. Even the renters we had on our ocean side house chose to drive on the beach so they could fish from the beach. At least, when we had the beach front rental folks had a beach to walk to - our house on the soundside is a different story. Access to our beaches by pedestrians and ORV is essential to the economy of the entire area. Those visitors and owners who do not have beach side homes or rentals are completely left out of the picture when it comes to beach access if the beaches are closed to ORV. From the time that it was announced that beaches would be closed, we have been getting as much information as possible about the reasons why and generally to keep our friends and renters apprised of what was happening to this National Recreational Seashore.

It all boils down to who has the most influence and available money to make things happen - obviously National Audubon and Defenders of Wildlife have what it takes to make the difference - lots of money and the ability to pick and choose the right time to go before the perfect federal judge. For the local communities to come up with the lawyers and money to be on equal footing with national groups is next to impossible.

We have been driving on the beaches for years and have a huge respect for the local fauna and the wildlife. The birds and fauna are what make Hatteras Island what it is. The birds are special to everyone - especially the Piping Plovers - they are having a hard time surviving even with the help of federal judges, the National Park service, Audubon and Defenders of Wildlife. WHY - It has come to our attention that the fauna where the Plovers like to nest is not the best for their nesting - they like open spaces on the beach to protect them from predators. Obviously the area around the point is grown up with lots of grasses and shrubs - not conducive for this particular birds. When we found out that the natural predators (who have as much of a right to survive and live) were being shot so that these birds might survive + closing the beaches and keeping everything a way is NOT the way that mother nature works. The Plovers are not destined to survive in this area with or without pedestrians or ORVS on the beaches. Another factor that the Park Service can't stop is the weather - The Noreasters and hurricanes that hit this area of the Outer Banks are also natural predators to these birds and their nests.

In conclusion, we do not support any of the choices that have been given to the citizens of the United States regarding use of the beaches on Hatteras Island. We do support information from the Park Service regarding use of the beaches - (currently the information is located on the access road to the beach - it is very hard to read this information when you are driving on the sand and cannot stop to read this important information). The regulations should be posted in a location that is accessible to the driver before driving on the sand. We want to continue to bring our pets to the beach (on a leash) cleaning up after them as we have always done. We want access to enjoy these beautiful, clean beaches that have stayed that way for years. Hatteras is a National Recreational Seashore - a place for everyone to use - those who walk over and those who drive on the beaches. Other than the big holidays - Memorial Day, 4th of July and Labor Day - when all the beaches were open - it was never crowded because there was more room to enjoy the beaches - all of them were open to everyone. Most of Hatteras Island is a wildlife preserve - that's the way it should be, but to take away the Cape Hatteras Recreational Seashore is a crime and an economical disaster to the community and those visitors that come to Hatteras Island.

Thank you for the opportunity to voice our concerns about the future of Hatteras Island and the folks who live and visit there.

**Correspondence:** As an avid fisherman for over 30 years and as a property owner in Dare County I have always believed that beach access is something that everyone should be able to enjoy. With the growing population beach access is harder to come by these days. The area at Cape Hatteras National Seashore has been a vital plus for the area and business. I support the conservation of any and all sea life and marine animals. However I believe it can be done in a manner that does not destroy an entire village. I fish for recreation; however these good folks on the island depend on the fisherman both commercial and recreational to support their families. I do not support an entire closure of beach access. This will destroy an entire island and many families and their business. I agree with the Dare County decree that request corridors; relocation and proper management. Some common sense must take place and work this issue out to satisfy the concern for marine life but also for the concern for peoples lively hood. If a total closure goes into effect you might as well forget the rebuilding of Oregon Inlet Bridge as the Island will dry up in just a few years as people leave and business goes under.

**Correspondence:** The series of Life Saving Stations (US Life Saving Service) within the Seashore are a symbol of the Cultural/Historic Value of surf zone access. These stations, in addition to rescue of crew & passengers of ships in distress, often served as community centers. These stations pre-date the establishment of the Seashore and co-existed with the park until the 1950's. I believe the DEIS fails to recognize this, or in fact any, Cultural/ Historical Value of surf zone access.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I believe that we must maintain driving access on the national seashores. I also believe that it is possible to protect the wildlife as well. It makes perfect sense to monitor the beaches and have temporary closures where a sea turtle nest is known to exist or endangered birds as well. Permanent closures would be an economic and public relations disaster. If people are not able to get onto the beach to fish, enjoy the ocean, the beauty, etc... then we are not able to enjoy these national parks. National parks are for the people. They need to remain open to the people.

**Correspondence:** This comment is to emphasize unjustifiable economic disruption to the beach area involved in this hearing. US citizens will suffer economic harm and loss that will be directly attributable to restricting beach access. Therefore, please carefully guarantee that qualified public vehicles will always be permitted reasonable beach access for recreational water-front activities.

I am a beach enthusiast that is attracted by the ability to drive on the water-edge sand and scout for schools of fish. Like most true outdoor sports men & women, I cherish and adore wildlife while being glad to pay fees for recreational hunting and fishing licenses that fund wildlife management and preservation. There is solid evidence that wildlife management is a successful approach to self-sustaining populations of wildlife, but management programs must be rational and well-balanced with human interests and necessities.

My friends and I have routinely visited the Outer Banks, mainly the Hatteras area, for over thirty years to enjoy surf fishing and duck/geese hunting. Many times we have made four or five trips a year, and we usually bring six to eight in our group. We usually stay four days, but sometimes for a week, to fish and hunt the coastal wildlife. As any reasonably self-regulating person can quickly surmise, there is a financial factor that is added or subtracted when people like me choose to make a trip or skip a trip to the beaches involved in this hearing.

It appears that some people are making irrational demands for unjustified wildlife protection that will involve closing beach access. Such a law or policy will certainly prevent me and my kind from contributing to the local economy, because we will no longer be attracted to the beach for sporting purposes. As you weigh your hearing testimony, please remember that closing the beach to stimulate wildlife will have a tangible negative factor on the local economics, directly attributable to closing beach access.

It was always my understanding that the National Seashore was primarily set aside for all US citizens. There is more among us than just one special interest group.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. **Correspondence:** I am concerned individual for the actual state of our coastal region and it's flora and fauna. I have lived on the Outer Banks and on NC's coastal region for the last 40 years and understand everyone's point of view, including those of the locals, the natives, and the visitors of this region. I am an avid surfer and lover of the NC Coast and it's wildlife.  
My recommendations are that private vehicles should not be permitted on any of NC's beaches. In the past years, allowing vehicle access to our beaches has gone way out of control and has caused many problems to our wild life and to the keeping the beaches in a pristine state.  
I believe that anything heavier than a human being's body is not natural to the environment and should not be allowed on natural offroad areas. This includes the beach areas. I do believe that our natural parks are for all Americans and their visitors and should be kept as pristine and beautiful as possible. We should allow access to pedestrians in most areas most of the time of the year, as long as wild life and fauna are not jeopardized.  
Surfing and sports fishing should be allowed most of the time of the year and in most areas as long as it doesn't conflict with wildlife preservation. Heavy fines should be kept for offenders that leave trash and any debris on beaches and in park areas. Dogs should be kept on leashes and their fecis picked up by their owners.  
Hunting should only be allowed on certain species if and when it protects that species from disease and overpopulation. This means that open season would not occur yearly, but only when necessary as determined by wildlife officials.  
Thanks for letting me vent my opinion.  
Sincerely,  
Concerned NC Surfer

**Correspondence:** To Whom it May Concern, Please do not close our beaches. OPEN THE BEACHES TO PUBLIC ACCESS!! The beaches have been the reason why so many people come to the Outer Banks. You will hurt and have hurt several hundred people and their business's by closing these beaches. They have not been able to rent their homes that they use for a business and the local area business's have lost more than 40% of their income because of these closures. I live on sound in Manteo and we run a Pet Sitting business and have seen a dramatic drop in people calling us because they can't afford to go any where due to these closures. Please listen to these comments and re-open the beaches.

I recommend that instead of closing beaches why don't they surround the bird nest or turtle nest with 3 poles and wrap "YELLOW" not gray tape around these poles that say keep out. You could use the police tape. By using yellow tape people will see this so much clearer. Also why don't we take care of our turtles like they do in Florida? Instead of protecting the nest take the eggs and incubate them and release them once they are big enough and it is safe to do so. This way we would not loose one turtle!!

Additionally I do not feel it is fair that every time their is damage to a area that we should loose another 80 feet of beach. Why should the public pay for 1 persons ignorance?? Also how do you know it isn't some environmentalist that is trying to get more area on the beach closed?? Why isn't there an investigation before the beach closure is added to??

PLEASE OPEN THE BEACHES!! We are a resort area!!

Sincerely, Diannalea Knight

**Correspondence:** I am writing to you today because my family enjoys recreation in the Cape Hatteras National Seashore Recreational Area. I support H.R. 718 and S.1557 which would reinstate the National Park Service "Interim Management Strategy", pending the issuance of a long-term management plan, for America's first National Seashore, on the Outer Banks of North Carolina where recreational access was promised in the enabling legislation.

I'm in the vacation rental bussiness, this is the reason our vacationers come to the Outer Banks year after year! And this is what keeps them coming back year after year. Best beaches and being able to use them as they have always used them.

Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
 Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
 This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
 The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
 \*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
 \* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
 \* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I agree with the Coalition To Preserve Beach Access position statement on the DEIS for the Cape Hatteras National Seashore .Promises and commitments were made more than fifty years ago to the people of the island when the park service acquired the land to open the park to provide free and open access . I feel the law suits have no validity and should be overturned and the filing parties should be held accountable to make all affected parties whole. The SELG and Audibon society have no right to deny access to a National Park for any reason. The Seashore is culturally and historically significant, and access should be protected at all costs.

**Correspondence:** Mike Murray, Superintendent Cape Hatteras National Seashore  
Dear Mr. Murray & Park Service Personnel: I have been watching the debate the last few years on ORV planning for Cape Hatteras with increasing dismay. I grew up in southern Virginia spending summer vacations at Cape Hatteras, and still bring my kids back there now 40 years later. The beauty of miles of empty, wild beaches on the island is a special thing that is extremely rare anywhere on the East Coast. The current "Plan F" favored by the Park Service is either a sham or a misunderstood disaster- it appears to protect only ~3 miles of beach for pedestrians, and much of this is narrow, adjacent to roads, motels, etc. Opening this much beach to large motorized vehicles would destroy any chance that I would ever bring my family back to Hatteras for a vacation. I am sure it would have the same effect on thousands of other tourists. There is nothing fun or pleasant about walking or swimming on a beach with ORVs roaring back & forth. I urge the Park Service to put real and meaningful restrictions on ORVs, keeping most or all of the Hatteras beaches free from the noise and habitat destruction ORVs would bring. Sincerely, Tom Egelhoff

**Correspondence:** My wife and I first visited the Outer Banks in the early seventies and continued to come back for several years until we had our first child in 1981. We did not return to the area until our three daughters were a bit older and continued to visit Buxton for many years thereafter.  
Our daughters consider those vacations to be the best memories on their childhood -- especially when we purchased a vehicle which allowed us access to The Point and they learned how to cast a fishing rod in the surf.  
We always acted responsibly when traveling to and from our favorite locations and we observed that the vast majority of the people we met were also thoughtful and respecting of the environment.  
We would like to express our opposition to the severe access restrictions to the area being considered and to encourage you to find alternatives that encourage rather than discourage our children to return to their favorite part of the coast.  
Thank you for your consideration.

**Correspondence:** I disagree with the NPS prohibition of pets on the seashore during bird breeding season, including in front of the villages (Pg 136). Pets are easily controlled on leashes. Leash laws and clean-up laws are more than adequate for controlling pets at the seashore. They should be allowed on the beaches year-round as they are often considered to be four legged family members.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me. ORVs do not belong in environmentally sensitive areas. I don't drive my truck in my yard because I want a beautiful lawn, shrubbery, flower beds and vegetable garden. Neither should ORVs have access to sensitive dune and nesting areas. Let them tear up their own back yards!  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. **Correspondence:** I disagree with the extensive, inflexible buffers (Pg 121-127) proposed for nesting birds. Closures should be reasonable. Full beach closures are unreasonable and unnecessary. Birds don't nest in the water. Pedestrians should be able to walk the entire seashore and a corridor for pedestrians could easily be provided near the water.

**Correspondence:** As a frequent visitor of the Outer Banks for almost forty years, I believe that vehicles should continue to be allowed beach access, particularly at the point. Personally, I only visited the point by fourwheel vehicle during a couple of summers. Other years my family and I walked the 1 1/2 miles from where we rented, to the point. But whether by foot or vehicle what I consistently witnessed were people enjoying this natural habitat, while respecting it and doing nothing to destroy it. I believe that the natural wildlife and humans can co-exist in this environment as long as some simple precautions are followed. Just as fishermen are restricted by the amount and size of fish they may keep, on land visitors are expected to stay away from nesting areas, watch for signs of turtle nests and mark them, throw back unwanted catches, and take their garbage with them. I personally have observed this kind of respectful behavior from most people that visit these pristine coastlines. I therefore respectfully hope that the final decision will be to continue allowing access to the beaches by vehicles, while rules are enforced. People that follow the rules should not be restricted from these areas.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I would like to go on record as being adimently in favor of ORV rights in the Cape Hatteras National RECREATIONAL Seashore. I have enjoyed the Outer Banks for many years. I am now 66 years old with three stints in my heart, and can no longer get to the beach to fish without my four-wheel drive pickup. I cannot believe that organizations from outside our state, and with unscientific data, have been able to impose their will on our judicial system, our government and our Park Service. Please revise your Plan F to give much more beach access, which is our heritage and the Park Service's promise to the people.

**Correspondence:** Opening comment I and my Family would liked to have commented in person to the unfair and illogical proposals in this plan, but like most people who this plan will affect we are not able to attend the public meetings. We are simple people who treasure the time we get to spend each year in the Cape Hatteras Recreational area of which is the correct name as it was when it was created. We hope our opinions will be read and considered as government is "for the people by the people"
