beaches and result in less disturbance of wildlife, which are important to me.

The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

Cape Hatteras is one of the few beach areas I know of where ORV use is permitted on beach/wildlife areas. Its fun for those who have ORV's and has been allowed for many years. Its not necessary tho. It is necessary that we keep some areas of this pristine beach available and safe for wildlife. I live near Va Beach and enjoy it year round. To my knowledge the only area of Va Beach that is legal for ORV's is the southern end at Sandbridge. Va Beach has taken another step to make the beach accessible for people with disabilities and yet not harmed the wildlife. They have put wooden catwalks from the boardwalk almost to the ocean where handicapped people can ride wheelchairs down to the waters edge and enjoy it from sideareas off the catwalks. These catwalks have harmed no wildlife and do not interfere with non-handicapped persons from enjoying and accessing beach areas. My congratulations to Va Beach for this new method of making the beach more accessible to persons yet not disturbing wildlife. It is something possibly Cape Hatteras could consider.

Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
 Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

**Correspondence:** Beaches of Cape Hatteras are nesting areas for shore birds and sea turtles. Under no circumstances should vehicles be allowed on any beaches while eggs or young are present on any beaches in the area. Some migrating birds are dependent on feeding just at the edge of surf and sand to get enough food to complete their migratory cycles. Other birds winter on North Carolina beaches. Even when the obvious birds and reptiles are not present there are invertebrate animals in the sands at all times. Sand is compacted by vehicles and these animals are negatively impacted. Since they are the food for larger animals the impact goes right up the food chain. Beach grasses that help to control erosion are also destroyed by vehicles. Vehicles are also a danger to pedestrian on the beach or children playing near the surf. I have had ORV come flying by me at very close range. The best plan is to have no vehicles on the beach at any time.  
Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

I have been going to the Outer Banks since I was a small child. The area has had a great deal of change in the fifty years I have been visiting. The whole area is already pushed to the limit. The ORV.s have plenty of area to ruin. They don't need all of it. I don't think they should be allowed to do so. I know that this has always been going on, but the people today have no respect for anything! Please don't let the whole area be ruined, let's push for protection.

Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
 Having visited Cape Hatteras National Seashore, I have seen firsthand the seashore covered in vehicles and the drivers' disregard for the delicate balance of the environment and the creatures that inhabit the area. Many drivers try to push the limits of their vehicles to see if their vehicles can "pull" out of the sand, ultimately leaving deep ruts and disturbed beach. Vehicles drive through gathered shore birds purposely to scatter them from resting on the shore.  
 The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
 Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. I feel that it is your responsibility to see that the final plan reflects the will of the majority of all citizens, that is what democracy is all about. A vocal minority must not be allowed to have an unproportionate impact on the decision.  
In my opinion, there should be NO orvs anywhere in any national park! They are ruining our environment.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.
- \* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.
- \* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
Birds and turtles can't live with ORV's, but ORV's can work around the birds and turtles.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

- \*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.
- \* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.
- \* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

**Correspondence:** I vacation in the Outer Banks 2 to 3 times a year

After reviewing the NPS DEIS I must disagree with any of the six alternatives within the document.

I have; however, reviewed the 77 page Coalition for Beach Access Position Statement signed by several groups that were a part of the negotiated rule making process and it by far succeeds in furnishing the best visitor experience while maintaining the needs of protecting the fragile resources.

Please consider all aspects of this alternative and put people back into the management of Cape Hatteras National Seashore.

**Correspondence:** TO Whom It May Concern;

I am writing on behalf of my family who have been vacationing on the Outer Banks for the past 6 years. It is my parent's who first vacationed here over 20 years ago that instilled in me the desire to return to bring my children to what has become tradition, appreciation, beauty and memories that will last a lifetime. I believe that the good people of the Outer Banks have something to share with all of us. To take that away a Public Park for years, would be a travesty. We can honor our environment without eliminating public access. If respect is taught correctly, we should all be able to enjoy the beauty of the Outer Banks. Also, I should think in times as they are, the Local, and State economy would suffer greatly without the tourists, and the families who have homes that vacation on the Outer Banks and those who support business on Hatteras Island. Please think long and carefully on the impact the denial of beach access would have. I have for years talked to friends about what Hatteras Island has to offer, and that once you go, you will always return. Please let's hope we can keep it that way.

Yours Truly,  
 Laura J. Krementowski

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the

alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. I own a Jeep and enjoy driving in out-of-the-way, wild places. But I also know that it is important to preserve these places for wildlife and people on foot. I remember hiking for hours in the deep mountains of Idaho, only to have the serenity destroyed by the brp brp brp of motorcycles. I had a similar experience while winter camping on an ocean beach in Maryland. Sure, people need places to ride off-road vehicles, but people and wildlife also need places where no vehicles are permitted.  
Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

 Off road vehicles have had too much access to our too-few beach sanctuaries. It is time to protect these areas, not try to provide access to cars which already control too many of our natural lands. The National Park Service needs to focus its efforts on the protection of wildlife, not on managing vehicle access to supposedly protected beaches. Vehicles belong on roadways, not on beaches.

The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

I have visited the Outer Banks and hope to visit again. Please prohibit or limit ORV use. The natural resources at the Outer Banks are too precious to lose.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

 I have to admit that I have driven out on those beaches many times over the years but, now that I understand the problem better, I vow to never drive on them again. I'm sure most intelligent folks would be more than happy to make the same very small sacrifice to help keep the area so special.

Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
 Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
 The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
 Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
 Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
 Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. **Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

As a homeowner in Southern Shores (NC), I am particularly concerned that we not allow our use of the beach to threaten other species. I would appreciate your working to prevent this type of destruction however possible, including better education of the dangers ORVs pose to other species. Perhaps publicity would help, including signs on the beaches.  
thank you.

Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent

with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. **Correspondence:** I am writing concerning the future management of off-road vehicles (ORV) within Cape Hatteras National Seashore on North Carolina's Outer Banks. Years of unregulated ORV use have taken their toll on Hatteras, contributing to a dramatic decline in wildlife populations in the area. The park's beaches are crucial nesting areas for rare birds and threatened and endangered sea turtles and their young. Each of these species is federally protected under the Endangered Species Act, and the National Park Service has a legal obligation to protect them.  
Please adopt responsible guidelines for the use of ORV on Cape Hatteras National Seashore. I urge the National Park Service to implement the strongest protection possible for the future well-being of imperiled wildlife at Hatteras.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating,

and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I grew up going to the Outer Banks, and looked forward to it every summer. I spent hours wandering along the shore, from Kitty Hawk to Emerald Isle. But my favorite times were always when we took the ferry out to Cape Hatteras National Park. I loved this wilderness, how isolated it felt, and all the birds and turtles that nested on the shore.  
 One thing I always hated, though, was when a car came driving up. As a kid it took away the feeling of being on an adventure, and I always worried about the bird nests I had just seen. What if the turtles got run over, or the baby turtles got caught in the tracks of the tire tracks, and never made it to the ocean?  
 Now that I am an adult, I still love Cape Hatteras, and am more active in its protection. As a kid, I worried about the cars driving on the beach, and now as a well informed adult I realize my worries were well founded. Although only a few people drive cars on the beach, these effects cars have a huge impact, both on the wildlife and on the enjoyment the rest of the visitors have.  
 There are many places to drive on the beach in the developed regions of Outer Banks, but one of the amazing things about Cape Hatteras is its feeling of isolation, as though you have wandered into a place which has been intentionally protected by people who know the past, and want their grandchildren to have the opportunity to love a place away from the mechanical noise of cars. To walk down the beach and find a the trail where baby turtles crawled into the ocean, not the tire tracks where they were trapped and consumed by crabs. To be amazed by the park service putting family enjoyment and nature protection as a priority, rather than allowing troublemakers to smuggle cases of beer in the back of their trucks.  
 In summary: I support Alternative D, if you would please change it to put more emphasis on pedestrian access and greatly limit the area which cars can drive on the beach. Preferably, they would not be allowed at all.  
 Thank you very much for allowing me to comment, and taking the time to read and review all of these inputs. What you do is so important, and in many places it is only in the national parks that I can get away from the sounds of the city and experience the work of people who steward the land.

Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the

alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. **Correspondence:** Thank you for the opportunity to comment on the National Park Service's proposed plan to manage off-road vehicle (ORV) use on Cape Hatteras National Seashore. I support maximizing the restrictions on ORV use, as ORV use has too high an environmental impact and diminishes the enjoyment of those who get out of their vehicles to truly experience a place.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I am writing to you to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
It is important not to place short-term pleasures for a minority of people over the long-term wealth fare of the environment for future generations.

**Correspondence:** I love the Outer Banks - it's one of my favorite places in the world to visit. I've always been surprised and even shocked that vehicles are allowed on the beaches. I know last summer I went on a wild horse tour and for the first time ever was in a vehicle on the beach, our guide told us about horses that get hit and killed by the vehicles that drive up and down the beaches racing each other at night, and the drivers are frequently drunk. I was so disturbed by those stories, but had not even thought about the other animals like the turtles that need the beach to lay their eggs and then the babies need to get safely back to the ocean.  
I felt that the vehicles all over the beach not only took away from the beauty of the Outer Banks, I also felt that lots of young crazy drivers were putting many in danger. I am all for not allowing so many vehicles out there and stricter enforcement on the drivers behavior - this will keep the beaches safe for all of the animals and people.  
I plan to return to the Outer Banks over and over again, it for me is one of the most beautiful places in America.

Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Although my wife and I get to Hatteras much less than we used to when our son was growing up, we remember the open beaches and grassy dunes. That was in the 1970s when there were still lots of piping plovers and sea turtles. Now it's 2010 and both plovers and sea turtles are down 90%. Back in the 1970s, liberal ORV rules made sense, but now with plunging populations of rare species, we must tighten the ORV rules to match the changed circumstances.  
Please choose Alternative D of the proposed management plan.  
Cheers, Larry and Louise Barden Charlotte, NC

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
I use the seashore frequently as a pedestrian (I even hike from the parking lot out to cape point regularly), and the quality of my experience is generally diminished by the presence of ORVs. Furthermore, I feel strongly that the seashore's core mission of protecting birds, turtles, and other wildlife, is of paramount importance in formulating any management plan.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
My entire family and our local nature groups have been visiting the outer banks and the National Seashore for the last 30 years. We have spent many nights in Nags Head and Buxton in the pursuit of wildlife and the serenity that the area gives us. It is also one of the few major resting and nesting areas for species that are quickly running out of homes. Please, Please Please pick Alternative D or all of these tourist dollars into the local economy my dry up. That pales in comparison to loosing our nature because it was run over on the beach by an ORV!  
Thanks!  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

I believe every effort should be made to protect these beaches.....  
If you are duty bound to provide these areas for ALL Americans, then you are bound to protect them for ALL Americans to enjoy. Not just the few irresponsible folks on ATVs or ORVs.....  
The beaches should be kept pristine. I have not yet seen these areas, as I am sure millions of americans have not either, and when the time comes to visit, I would like to see them as they were. Not ripped up with tire tracks.  
The very least you can do is protect at least some of the areas. And it should be a large area.....because not only is the sight of these vehicles and tracks the issue, the SOUND should also be an issue.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.  
Thank you and hopefully there will be birds and turtles for me to see some day.

**Received:** May.07,2010 07:28:24  
**Correspondence Type:** Web Form  
**Correspondence:** Thank you for giving all parties a chance to comment. I am for ORV access as well as keeping our wildlife protected. I was not intending to write a letter, but when I received an email from Defenders of Wildlife, I had to respond. The DOW really knows how to spin anything in their favor. The closures being put up by NPS are very unreasonable just for a bird, and some of these birds are not even on the endangered list. I don't believe our President is protected with this much of a buffer. As far as giving wildlife a place of their own at CHNSRA, there is plenty of shoreline between Oregon inlet and Rodanthe that can not be used for ORV use. If the issues in hand were really about the birds and their eggs and the turtles and their eggs....why not move them to the shorelines mentioned above?  
When the Consent decree was put into place 2 years ago, there has NOT been an increase in fledged birds. Nature takes its course in its own way, but we still have people thinking they are God and can save each precious animal they deem good enough to be saved. I do not think the NPS can come up when the last time a bird or turtle egg has been crushed by ORVs.  
I personally have been traveling to the Outer Banks since 1998 when a friend introduced me to this beautiful area. I love traveling on the beaches with my ORV and consider myself a steward of this magnificent beach. I would never intentionally try to run over a bird, turtle or any other wildlife on these beaches. And I also know I speak for other ORV users in this matter to give us the right and opportunity to share the beaches with wildlife. If NPS is protecting a nest, fine. Just don't take the beach all the way to the water....give ORV users a corridor to get thru...in other words, ACCESS.  
Give ORV users a fair outcome in this situation as well as the wildlife. We CAN co-exist with wildlife AND get fair access for all types of recreation.  
Thanks again for the opportunity to respond.  
(As you are aware, this was not a pre-written form letter that you will see from a vast majority of people associated with Defenders of Wildlife and other affiliates. It from me and my personal feelings.)  
Sincerely, Robert Dossenbach OBPA member

**Correspondence:** May 7, 2010  
Mr. Mike Murray, Superintendent Cape Hatteras National Seashore 1401 National Park Drive Manteo, North Carolina 27954  
Dear Superintendent Murray:  
I am writing on behalf of the N.C. Marine Fisheries Commission to comment on the Draft ORV Management Plan/EIS (DEIS) for the Cape Hatteras National Seashore.  
Our commission is charged with regulating recreational and commercial fishing activities in the coastal waters of North Carolina and we feel strongly that fishing is an appropriate and traditional use of the Cape Hatteras National Seashore. It is our belief that access should and can be maximized for all user groups while providing protection of our natural resources.  
Our commission, along with the Division of Marine Fisheries, had representatives on the Negotiated Rulemaking Advisory Committee which ended without consensus. We find that many of the statements and positions of the Coalition for Beach Access are consistent with the work of the Negotiated Rulemaking Advisory Committee; therefore, we endorse and support the following portions of the position statement of the Coalition for Beach Access relative to the Draft ORV Management Plan/EIS (DEIS) for the Cape Hatteras National Seashore:  
? 3.0 Importance of Public Beach Access ? 3.1 Traditional and Cultural Values ? 3.2.3 Fishing ? 3.2.8 High Recreational Value Ocean Beaches ? 3.2.9 High Recreational Value Sound Side Locations ? 3.3 Commercial Values ? 5.0 Selected Legislation and Management Policies Relevant to an ORV Plan

? 6.1 ORV Ocean Side Ramps ? 7.0 Conclusion In addition to the above comments, the Marine Fisheries Commission is concerned about the recommendation that Hatteras Inlet Spit and North Ocracoke Spit areas be classified as non-ORV areas year round. These locations are very important to the recreational and commercial fishing public. We believe seasonal access could be allowed while protecting species of concern.

Thank you for the opportunity to comment on this important issue of mutual concern.

Sincerely, W. Robert Bizzell, Chairman N. C. Marine Fisheries Commission

Cc: N.C. Marine Fisheries Commission N.C. DMF Director Louis Daniel Habitat and Water Quality Advisory Committee Anne Deaton Sara Winslow

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

 Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
 Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
 The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
 Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at

least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
Enjoying the beach and nature is altered when vehicles are allowed on the beach. Usually they are loud, smell and disturb the environment. With all that is happening in the environment it would be a good time to limit the destruction done by man.  
The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent

degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I first wish to comment the National Park Service for engaging in an involved, deliberate and transparent process in this controversial issue that is now about two decades old. The current administration of the Seashore, and several levels above in the NPS and Interior Department, realize the significance of the important natural resources at risk in the Park, especially when faced with greater human disturbance as well as climate change. Balancing those needs with human recreation is the professional challenge that all NPS managers must face. I have several comments to make, even though I admit to not reading the entire 600+ page document. I do concur however with selection of Alternative F by the NPS as the preferred alternative. My major comments are: 1. I was pleased to see that ORV permits would now be required for all off-road use in CAHA. In addition, having an educational course required is important. I commend the establishment of a fee structure as well. This fee should be set at a rate (based on an estimate of the maximum vehicle use during summer weekends at CAHA) to offset the costs of hiring additional seasonal law enforcement personnel to monitor the beach use and implement control measures. 2. As at other Seashores, I would prefer to see a numerical limit placed on ORVs using certain access ramps. With no limit set, an unsustainable number of vehicles could accumulate and ruin both the recreational experience as well as degrade the environment. 3. I commend the NPS on maintaining the buffer distances for the various bird species and sea turtles. 4. In chapter 5, under Consultation and Coordination, I did not see mention of any type of oversight committee or board. As the NPS adheres to a policy of using adaptive management, it seems a review process by an external panel or committee made up of scientists and managers should be established to periodically review protocols and results of key management operations. This allows for future modification and flexibility in CAHA management.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. **Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
 The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
 Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only

16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** Since moving to North Carolina six years ago, my family has greatly enjoyed the easy accessibility of many beautiful outdoor spaces. In fact, that was one of the greatest attractions of North Carolina for us! We're all animal lovers, too, and love the opportunity to enjoy wildlife in its natural habitat rather than only in a zoo. That's why I'm writing to comment on the National Park Service's proposed plan to manage off-road vehicle traffic on Cape Hatteras National Seashore. Although we haven't been to Cape Hatteras yet, it's definitely in our plans. Seeing the turtles and other rare wildlife will be quite a treat for our children, so I wanted to let you know my thoughts on the proposed plans.  
Of these, I support Alternative D if it can be modified to provide greater pedestrian access. As you know, this was identified as the environmentally preferred alternative in the DEIS. It would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. I am personally very concerned about the fate of many forms of wildlife, especially critically endangered sea turtles that lay their eggs on these beaches and many shorebirds that depend on the Cape Hatteras National Seashore, if this critical area is opened to extensive OTV use. Of the alternative plans presented in the draft environmental impact statement, Alternative D seems to be the best choice if it can be modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
At a minimum, the park's final plan should consider the following principals if the modified version of Alternative D is not enacted:  
Provide Equal Access for All Visitors: If ORV use is allowed within the park, please reserve at least half of the beach year round for non-ORV users and wildlife, particularly considering wildlife nesting, wintering and migration areas. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers should, at a minimum, protect breeding birds and sea turtles.  
Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
I thank you for your thoughtful consideration of these issues as you move forward in the development of the Cape Hatteras National Seashore Management Plan.

I visit the Outer Banks frequently. One of my favorite activities there is being able to observe all the wildlife that abounds there. I sincerely hope that my grandchildren and their grandchildren will also have the opportunity to see this also. It would be so very sad, if one day, future generations could view many of the wildlife through archived data only.

Please protect these fragile lifeforms.

Thank you.

Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a

chance to rebound to its traditional numbers and diversity within the park.

Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Although I have not yet been to Cape Hatteras, during my undergraduate years, I took two classes at the Dauphin Island Sea Lab, off the Alabama coast. During the field work for those classes, we learned about the damage ORVs could do to the grasses growing on the dunes. Without those grasses, the dunes become unstable or are destroyed, thus wiping out a primary barrier to hurricane winds and water damage to homes constructed further inland. In addition, some of our field work took place in the tern and skimmer rookeries on Dauphin Island, a magical place, where the birds lay their eggs and rear their young directly on the sand of the beaches. Any ORV use in such nursery areas would result in significant deaths of the young birds. Turtles nesting on such beaches would be even more vulnerable, since there are so many fewer of them than there are sea birds.  
Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

On a personal note, I despise these ORVs. They are loud, often run by people who are drunk or out of control, and they tear up the landscape. They also terrorize the critters in the area. I would support banning ALL of them except on a person's own land.

Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. My husband and I support the defenders of wildlife organization, and their well thought out recommendations follow. I believe that it is the responsibility of the Park Service to Protect the Resources first and foremost. Particularly as we are all moving towards the big Park birthday. If there is no resource, all the rest begins to fall away. I am not insensitive to the desires for off-roaders enjoyment, but rely on the the Park Service to create a balance which will ultimately meet it's challenging charter, protect the resources. Thank you for all you do on our behalf, and that of our grandchildren and theirs.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
I am a person who views wildlife as extremely important whether or not I am there to see it! It is not all about ME, but about the creatures that share this planet with us. That is why I am commenting on a plan that involves ORV use. ORVs are dangerous to wildlife and should be regulated as such. If you choose not to put Alternative D in place, it is my opinion that the following should be included: \*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. How is that fair? Half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
Protection of the natural resources and wildlife of the Seashore should be paramount, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.  
I hope you will take this letter and its comments very seriously. Those of us who care know how important it is for people in power to listen and understand. Thank you again.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding,

migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

I have visited this National Seashore multiple times since 1996, and each time I visit, I am amazed how a national treasure has continued to be commercialized and built upon. I don't understand how a place as unique and special as the Outer Banks and Cape Hatteras can support the seemingly unbridled loss of nature and addition of so many buildings. On top of that, the ORVs impact on what beach and natural areas are left are impacting the type of wildlife a unique place like Cape Hatteras should be designed to protect. Not only do I support control of ORVs, but I want to trust that the government looks out for and protects steadily declining natural areas in this country--especially those that have been designated as National Seashores many years ago. Please take this small step toward protecting more of what is left of this amazingly beautiful and unique area for the wildlife that depends on it and those Americans who wish to visit a national treasure.

Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
When I first visited Cape Hatteras a few years ago, I was thrilled with what a wonderful place it was. The nature and beauty were spectacular. I hope that we can preserve it as such for future generations. The alternative plan mentioned would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

**Correspondence:** Mike Murray, Superintendent Cape Hatteras National Seashore 1401 National Park Drive Manteo, NC 27954  
May 7, 2010  
Mr. Murray,  
It has been brought to the attention of the kiteboarding community that a variety of plans are being considered in response to proposed environmental and ecological concerns. The Outer Banks of North Carolina is a sanctuary for many beach goers, sports enthusiasts, wildlife observers and most importantly, the natural environment. We, as a community, feel that it is important for the environment to be protected and thus understand certain steps may be needed to achieve this goal. Thank you for evaluating the options to improve the environmental conditions at one of the greatest destinations in the United States of America.  
However, with the aforementioned said, please consider the responses you choose carefully. Minimalist environmental management approaches have worked well throughout the United States' National Parks. Closing extensive sections of beaches, the sound, and water ways will strip away the very nature and reason for why we appreciate the land in its current state. It can be said with great certainty that all frequent and casual users of this place intend to preserve its natural beauty and respect its wildlife.  
We strongly feel that the Historical, Cultural, and Economic ramifications of the proposed plans have not been adequately addressed by the Draft Environmental Impact Statement (DEIS) as is required.  
Should the environmental changes impact our communities' sport (as it would in Plans D, E, & F) we would be forced to reconsider our frequent and environmentally friendly utilization of the Outer Banks. Other user groups such as surfers, fishermen, beachcombers, and virtually all other forms of tourism will also be discouraged from visiting Cape Hatteras if beach closures are greatly expanded. This will have a severely negative impact on the local economy and way of life that the residents of Hatteras Island have enjoyed for many generations. It will also take away something that is important to the lives of thousands of people throughout the United States and around the world.  
If people, and especially children, can not experience the environment how are they going to learn to help you protect the environment?  
Kind Regards, Josh Benvenuti

**Correspondence Type:** Web Form  
**Correspondence:** I am sharing with you the comments I recently submitted on the Cape Hatteras National Seashore Off-Road Vehicle (ORV) Draft Management Plan/Environmental Impact Statement (DEIS).  
As an avid angler on the North Carolina seashore, I am strongly opposed to the National Park Service (NPS) preferred alternative, Alternative F, in the DEIS and urge you to make significant changes to the preferred alternative in order to provide both reasonable resource protection and reasonable public access to public land. Recreational fishing is one of the most enjoyable American pastimes, and Cape Hatteras National Seashore has some of the best surf fishing locations on the east coast - accessible only by ORV.  
Alternative F is the most restrictive management option to date, far exceeding any sense of balance between resource protection and public access and betraying all promises made to the public regarding recreational uses in the seashore. The majority of the provisions included within the preferred alternative far exceed anything proposed by a majority of the Negotiated Rulemaking Committee, including excessively large resource closures

(buffers), unnecessary year-round and floating closures, and the lack of access corridors around or through resource closures.

In order to restore balance to the DEIS, I highly recommend that the NPS revisit the proposal put forth to the Negotiated Rulemaking Committee in December of 2009. It provides the necessary protections for wildlife resources while having the support of a majority of the local community. Without reasonable ORV access, responsible anglers like me, and the local economy that is supported by recreational fishing, suffer greatly. I urge you to provide a better balance between resource protection and recreational uses by incorporating the December 2009 recommendations from the Negotiated Rulemaking Committee into the preferred alternative.

Sincerely,  
Michael Keefe

<b>Correspondence:</b>	I've been traveling to the Hatteras Beaches since the middle sixties and owned a home there for the last 15 years. None of the past policies, applied "science", closures, and restrictions have done anything but waste taxpayer dollars. I now go to a PUBLIC NATIONAL SEASHORE and am regulated by Audubon, SELC, and DOF by decree. I am against regulation by decree, I am against Alternative "F" and I am against the Seashore being run from opinions not backed by true science. I am for fair and balanced rules that incorporate common sense and ecological stewardship. No plan in the DEIS fits this description.

<b>Correspondence:</b>	I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me. The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D: Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park. Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles. Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

**Correspondence:** Cape Hatteras National Seashore beaches are crucial nesting areas for rare birds and threatened and endangered sea turtles and their young. I am in favor of more support for park visitors who enjoy areas without ORVs for recreational activities. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I have been enjoying the Outer Banks since I was a little girl--for at least 60 years. The beauty and the magic of the place is really unmatched. The Cape Hatteras National Seashore is one of this country's most valuable resources and must be protected to every extent possible to preserve it for future generations--not just of people but of the critters who call it home as well.

Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. In closing, I have to say that it is unbelievable that public officials allow beach access to ANY type of vehicle (with the exception of emergency vehicles, when necessary). Like many North Carolinians, I have witnessed many incidents of people driving wrecklessly or carelessly on beaches, posing an immediate danger to beach-goers (including young children) and wildlife. The beach is not a place for vehicles, especially recreational ones. Drivers who are inclined to drive on a beach are not inclined to respect it, to keep it clean, or to recognize the rights of beach-goers and animals. We have laws to protect sea turtle nests and hatchlings from lights. It makes no sense at all to deny them protection from off-road vehicles, which not only pollute our PUBLIC beaches at the inconvenience of many, but pose a real danger to people and wildlife.  
I urge you to BAN--not restrict, but ban--all vehicular traffic from public beaches, as a matter of public safety and ecological protection. The rights of a few to joy-ride on the beach do not supercede the public's right to safe, clean beaches, nor do they supercede the natural rights of animals to use the beach for nesting and hatching purposes.  
What bonehead thought of opening the beaches to cars and trucks in the first place?  
Please put a complete stop to this practice and make our public beaches safe and more accessible for everyone...except for the nincompoops who want to drive on them.

Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent

with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These folks have other places to drive their vehicles. They don't have to disturb the wildlife at Hatteras. Give the animals some peace for a change.

This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
Put Natural Resources First: Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
Establish and Meet Clear Goals for Wildlife Recovery: A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** Owners and riders of ORV's have plenty of places to play with their toys. The beaches at Cape Hatteras should not be used for this. Hatteras is beautiful and one of the few "wild" areas left on our over developed beaches in North Carolina. Please consider conserving this area for future generations and for the wildlife who live there and procreate there.

I appreciate the opportunity to comment on National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support Alternative D if modified to provide greater pedestrian access, which was identified in the DEIS as the environmentally preferred alternative. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principals should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
 Provide Equal Access for All Visitors: Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

<b>Correspondence:</b>	<p>I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.</p> <p>This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to</p>						

me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
Dear Superintendent Murray,  
My family, including my late parents and brother, my husband and two sons and our cousins, uncles and aunts, have been going to Cape Hatteras National Seashore since I can remember to gaze in wonder at the wildlife and beauty of the place. As soon as you arrive at the Seashore, you know that you are in a very special world. You see colonial waterbirds in flocks that you just can't find in most coastal areas. One of the most exciting aspects of the Seashore is the use of the beach by sea turtles to lay their eggs. As most of us know who have grown up reading the National Geographic, or watching Jacques Cousteau or Nature, there are only a few places in the world where these incredible creatures can successfully reproduce. And we are blessed enough to have them use OUR Seashore! We just need to take care of it by controlling the type and number of ORVs that come near the nesting grounds. I, therefore, support the Alternative D, which will be much better for both the animals and the tourists. It will benefit the natural environment, which is what makes the National Seashore at Cape Hatteras so attractive to tourists in the first place. And my family can continue to look forward to visits to this amazing place in the years to come.  
Sincerely, Katherine Clemo 4512 Laurelwood Drive, SW Roanoke, VA 24018

These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
The spirit of the law must be met. ORV are extremely destructive to habitat and animal. Some of these species should be considered national treasures as is the park

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.
