**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. Thank you.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a

chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a

chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I have spent many wonderful summers on the Carolina shores and will be following the progress of your efforts at Cape Hatteras. I look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. \*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. PLEASE protect the rare wildlife at Cape Hatteras National Seashore. They cannot speak for themselves, and all too often just get run over (no pun intended) by humans with whom they so generously share this Earth -- but do not receive the same courtesy in return. They need us to protect their habitat.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

Please, please consider what is written below. This is very important, not only to me, but to my whole family and generations to come. The birds and turtles of Cape Hatteras are an inspiration and a treasure to be protected. Please take a stand on this, don't back down, represent your community's voice on this.

Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

Speaking as one who stays at Cape Hatteras National Seashore, and spends money at local rental cottages, local restaurants, local bait and tackle shops (even though they have giant anti-Audubon banners), local recreational rental establishments, as well as National Park Service facilities, I believe this alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me. The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

I personally feel that the presence of ORV on beaches is plain stupid. ORVs should be severely limited. We have a similar problem in Florida. Please make Cape Hatteras NS a safe haven for nesting birds, sea turtles, and people on foot.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

- \*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.
- \* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.
- \* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

I wanted to write on behalf of the animals that rely on the Cape Hatteras Sea Shore for their continued existence. This area has been home to sea turtles and other marine creatures plus a vital stopping point for migrating shorebirds and a nesting area for many other birds. Their homes should not be run over by ORVs, nor should they be terrorized by these vehicles.

In addition, anything that would result in people getting out of their vehicles and walking along the sea shore seems like a good thing. We are in an oil crisis and more judicious use of this resource should be encouraged.

These bans have taken place on other beaches, often at first with resistance, but eventually people come to appreciate the beaches for multiple reasons, in solitude and with family and friends.

We have to take a stand for wildlife and wild areas.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

I do not believe that beaches such as this, in sensitive areas, should even be open to ORVs. Shouldn't there be places in the world where we are not subjected to vehicles? Where we and the wildlife can have some peace? I say ban them from beaches period! But since I know that won't happen...

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
Off road vehicles should be kept to specific non-critical areas. The majority of off road drivers do not take care to see what they might be disturbing. And even if they are the noise and interruption of pristine habitat is detrimental to wildlife. This isn't just a planet of humans trying to survive, it's a planet of all living things. No species owns it.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

My wife and I have appreciated our visits to Cape Hatteras in the past for the wildlife we have liked to think are protected there. In light of the Gulf Coast events and the obvious selfish disregard for wildlife humans who gambled with safety features for oil drilling, I should hope that you all are choosing to protect your wildlife from human impact.

Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. ORVs are noisy and spew pollutants into the environment and provide no benefit to those of us looking to find solitude in the beauty of nature. There are more of us in this nation than there are ORV users and we need to be considered equally in these plans.

**Correspondence:** It appears to me that the proposed alternative starts with the Consent Decree as a reference point. I do not believe that the CD should be used as a starting point, rather the Interim Plan, as it went through the proper qualification process. Using the Consent Decree is equal to letting a judge rule how the area will be managed, a responsibility for which they would not be qualified.  
There has been no consideration for historical usage in the DEIS. This consideration is required by Federal law. The total ban on night driving is ludicrous and limits how many people have historically used the area to surf fish at night.  
The closures for the spits on both sides of Hatteras Inlet and the area between Ramp 27 and Ramp 30 are unneeded and not based on science. Do not fence off areas of a Recreation Area created by Congress and make it a Wildlife Preserve. We have a preserve on Hatteras Island; it is called Pea Island and there is no driving and the PIPL still don't show up in great numbers.  
Move the turtle nests in jeopardy of being washed away, stop closing the beach for species that are not Federally listed as Endangered (AMOU), stop killing the predators, and clear the brush around the pond. Return the area to what it was before so many well-intentioned programs altered nature to the point that the birds moved out to the beaches.  
Please allow the people who actually visit CAHA to have a voice in how the area is managed as much as possible. Outside groups that have no investment in the area and are only out to promote themselves should have little to no voice in this process. - On an unrelated note, why do the dumpsters at the ramps have to be painted bright orange? They are an eyesore.

**Correspondence:** Just a quick comment.  
I'm an avid kite surfer/ windsurfer, who appreciates the need to protect wildlife along the shores of Lakes and Oceans..  
The Outer Banks, Cape Hatteras and other areas in question, reap the rewards of all the dollars funneled into the area from water sport enthusiast like myself... There has to be a way to keep all user of the shore line relatively happy while ensuring the safety and health of wildlife within these areas...  
I have no problem with the idea of keeping vehicular traffic off these areas, and propose the construction of more small, low impact ,parking areas on the inland side of the sand dunes... The money that tourism / water sports has brought to these areas throughout the years has to be of great importance to all in the area... If you ban access to these beaches during the prime months of the season, we will not come back, and will take our money elsewhere, if need be...  
Thank-you for your time.  
Respectfully, Tony Dobson...

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

- \*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.
- \* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.
- \* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

- \*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.
- \* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.
- \* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:**

Dear Mr. Murray:

I disagree with the sizes of enclosures in table 11, page 127. Based on my experience as a birder and fisherman on the Outer Banks and, previously, in CT, RI, and Mass., these enclosures are a maximum whose perimeters might be approached toward the end of a breeding cycle. Where an enclosure blocks access to a location on the water which is highly desirable for human activities there should be an access corridor.

I agree with the concept of developing an educational program that would increase peoples' understanding and appreciation of the natural community and dynamics of the Outer Banks. Such a program should be offered to everybody even if it is mandatory for ORVs and/or pedestrians on the beaches. I disagree with the need for "floating" enclosures for non-breeding birds (page 81, paragraph 4). Each of the proposed areas in which such an enclosure will occur is proximate to areas already closed to humans, not to mention the likely establishment of additional SMA, associated with nesting activities. I disagree with abandoning turtle nest relocation (pages 86-87) as an option for maintaining ORV access to an otherwise 'open' area. It is an option that could be used as it might be in the case of a likely inundation.

After reading the executive summary, my feeling of joy and privilege at being 'on the beach' ? whether in a vehicle or on foot ? became a feeling of trespass. I still feel a sense of stewardship and responsibility but it seems irrelevant and unwanted.

Though I'm not so hopeful that this process will soften the effects of some of the extreme attitudes that seem to be affecting the 'plan,' it is the process and this response is a sign of respect for the process. I heard many good comments and suggestions at the public hearing and hope this process can refocus the work of the Park Service toward the whole of its original mandate and prevent it from becoming primarily a policing agency whose task is controlling human access to the seashore ? especially the ORV users who, undeservedly, come off as outlaws in the DEIS.

Sincerely, (illegible first name) Hoge

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

These recommended plans are far more lenient than I consider necessary, but seem to provide a concession to meet the needs of the ORV drivers.

Having just returned from the Galapagos Islands, which have such strict guidelines - erring on the complete protection of all wildlife - I'm disappointed that we even have to have a discussion about this topic at all. It's sad how entitled the American public has become with regards to our vehicles and making sure we aren't inconvenienced by anything.

Please vote with the future in mind!

Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.
- \* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

- \*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.
- \* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.
- \* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. **Correspondence:** Attn: Mike Murray, Superintendent Cape Hatteras National Seashore 1401 National Park Drive Manteo, NC 27945

Dear Mr. Murray and members of the National Park Service:

I grew up on Hatteras Island and have gone to the beach my whole life. I used to swim from north Rodanthe to the pier and jump off of it in my youth. I will be 89 in July, and I still go to the beach with my sister, my children, and my grandchildren.

The beach does not belong to the Park Service. If anyone should stay off of it, it should be the park service itself. We always welcomed visitors, and were glad to have all people, so you can imagine the rudeness of your trying to steal our beaches. When the park service first came to our island, they promised the natives that they wouldn't prohibit them from using the land as they wanted. We trusted you; you let us down. We were used to being able to take a man for his word back then, but promises have been broken.

As for the birds, I feed them daily. We know our birds better than you do; they've been on the beaches with us our whole lives.

I pray God's blessings upon you, and that you will seek His will. Please don't take what doesn't belong to you, or involve yourselves in taking more from us than has already been taken. We've sacrificed enough.

Thank you, Lovie O'Neal Midgett

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be

consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I disagree with the Plan to transform the Cape Hatteras National Seashore Recreation Area into a wildlife sanctuary by restricting vehicular as well as pedestrian access to the beaches. Specifically, Alternative F is so unnecessarily restrictive that it cannot be rationally described as the Cape Hatteras National Seashore Recreation Area Off-Road Vehicle management plan because it all but eliminates Off-road vehicles as well as pedestrians. This plan will effectively eliminate a National Seashore Recreation Area and replace it with a wildlife refuge, without giving any weight to the cultural and economic consequences of this action. Of the 800 plus pages, only two paragraphs, are devoted to this aspect of the plans impact, not to mention the severe economic hardships that it will cause. As a homeowner in AVON, NC, I have already seen a significant drop, (almost 50 percent), in rentals for my home compared to this time two years ago before the restrictions on beach access were imposed. In addition, the plan does not give adequate consideration to the impact on the livelihood on the full-time inhabitants of the island as well. I have spoken to many individuals who previously vacationed on the outer banks, but have since decided it isn't worth the time or effort to make the trip any longer since there isn't any difference between Ocean City, MD, or Virginia Beach and the outer banks if they cannot enjoy the unique experience of traveling on the beaches to enjoy nature and the beauty of the Cape Hatteras Point.

My family and I have enjoyed the wonder and the beauty of the Cape Hatteras National Seashore Recreation Area since the early 80's. My children have grown up there and have many wonderful memories of the Point, its wildlife and freedom to explore it. Alternative F's overly restrictive guidelines will effectively deny future generations this experience, and destroy the way of life for all of the inhabitants of the island.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
It seems only fair to regulate the use of motorized vehicles on Cape Hatteras, an area preserved for its ecological value. There must be other less sensitive areas where ORVs can make noise and dump exhaust to their hearts' content. Why do they choose an area where their enjoyment may permanently damage the very wildlife that attracts visitors in the first place.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

I have visited the Outer Banks before for the specific purposes of birding and other nature related pursuits. In that regard, I find the ORVs to be a major negative to both wildlife and my own enjoyment of the area.

Why should a small minority of people (the ORV users and the companies which make those machines) be given such a large area to run their machines when the result is that both wildlife and the majority of people, who prefer a more peaceful experience, have to suffer as a result? The ORV advocates who live on the Outer Banks seem to not care that, to a large degree, they depend upon visitors to the area such as myself who really don't like what has been going on there and visit less often as a result.

I don't ask that ORVs be totally banned. However, I feel that the environmentally preferred choice is clearly in order, to the benefit of both the majority of people and wildlife. I am also in favor of some increased pedestrian access

Thank you again for genuinely considering our comments.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me. I once drove an ORV at several local Long Island beaches, but was always conscious of the wildlife that called the area home, or nesting regions, and took care to not disturb them. Sadly, too many other drivers do not take such care, and they are the problem.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. **Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me, to the coastal ecosystem and the Atlantic Flyway.  
The following principles should underpin the park's formulation of its final plan, should it mistakenly choose not to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide improved access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are bare minimums and should be increased to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

One final thought. In light of the recent oil spill in the Gulf of Mexico and the enormous loss there will be to wildlife and the coastal environment, we need to even more aggressively protect what we have left of our shoreline habitat.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
 Alternative D would provide two things which are important to me and to most other visitors to Cape Hatters: more opportunity for non-ORV uses of the beaches and less disturbance of wildlife.  
 Here are some key considerations in the park's formulation of its final plan, should it choose not to enact Alternative D:  
 \*Provide All Visitors With Equal Access. Under Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, more than half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
 \* Do Not Put the Wishes of a Few ORV Users Ahead of Natural Resources. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. Alternative F fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the Alternative F are inadequate minimums and should be increased if necessary to protect breeding birds and sea turtles.  
 \* Clear Goals for Wildlife Recovery Must Be Established and Met. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
 Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

I am a business owner and resident of Ocracoke Island, NC. I support the National Park Service's proposed plan to manage ORV use and protect our wildlife. I believe that many of my colleagues have raised fear and emotions to the point that they are not thinking clearly. Except for possibly the shops that sell only to the fishermen crowd, economic impacts are due to the overall economy, not to the management of our beaches. I believe the management of our beaches have been carried out in a balanced way that supports the local tourism trade and helps to create a safe haven for our wildlife.  
It would be unwise and uncomfortable for me to go to one of the local comment meetings. I believe many other people might feel the same way. I have been threatened on blogs when I express my views. I have had two incidents of vandalism at my place of business which of course I can't substantiate but vandalism had never happened before.  
Just thought you would like to know that there may be those of us who do support what you are doing, we are just afraid to be vocal!

Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. \* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

The point is, that even with maximum protections, there will be some natural or man-made disaster that will wipe out a large percentage of them anyway, so allowing any ORVs on the beach is just bad policy.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

**Correspondence Type:** Web Form  
**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me and my family. We appreciate that some disabled folks may have trouble accessing these areas so there should be some "handicapped" access available where ORVs might be allowed, with permitting in place, BUT as far as we're concerned the only "dissability" suffered by most ORV "enthusiasts" is their "thinking and emotional Disability" to see the destruction their toys create while they indulge their lack of values and their lack of respect for the environment and the futures of their own children as well as mine.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park. Personally I have NO interest in maintaining ORV areas at all but I don't see why they can't go elsewhere or get their "kicks" from other less destructive activities. Other resources such as fishing, both sport and commercial, are often restricted or curtailed when fish stocks are threatened with depletion for years at a time...why not have a moratorium on ORVs when bird and turtle life or wild areas are threatened...then have them re-open on a trial basis when things "normalize"....I still don't think it's normal to careen about the countryside on an ORV looking for "cheap thrills" One might as well hit the Nimitz or Hollywood freeways in Metropolitan California at rush hour and then weave around through traffic and ride the shoulder on the ORV's for real thrills!  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. We will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more

balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Vehicles should not be allowed on beaches anywhere, most particularly on our National Seashores. There are safety issues for humans and wildlife. One of the main purposes of our wonderful National Park system is to preserve and protect our natural resources, landscapes and environments. Allowing ORV's on our seashores make that task considerably more difficult, if not impossible. This is a national issue, not just a local or regional issue.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. **Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife. With the devastating oil spills and changing sea conditions, we must do everything we can to help our sea birds and turtles survive.

In my opinion, all ORV's should be banned from fragile habitat, but I know you have to allow more access. So following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
 Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
 This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
 The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
 \*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
 \* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
 \* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met.  I have often enjoyed off-roading at Cape Hatteras National Seashore. It is precisely for this reason, that I wish to add my voice to this issue. Sound conservation, habitat and wildlife conservation interests really do need to have priority. That is why I fully support the environmentally preferred Alternative D plan.  
 This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

It also seems inappropriate to be providing access to energy-wasting, noise-polluting vehicles at a time when conservation means not just protecting land, but also reducing and eventually eliminating frivolous, non-productive use of energy resources, such as fuels used to run off-road recreational vehicles. Their owners have the same access any of us do...their recreational vehicles have no such right.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

Comments on the DEIS for the Cape Hatteras National Seashore Off-Road Vehicle Management Plan  
Dear Superintendent Murray,  
I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access. This plan offers a better balance of uses while protecting endangered and threatened species. I've witnessed people walking past enclosures for Piping Plovers, wondering what the fencing was for. I was able to explain the reasons for the enclosures to an audience of beach-lovers who also wanted the opportunity to use the beach with their OVRs. Once they realized that the two beach uses could co-exist, they were fine with limiting OVR access during the nesting season.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

**Correspondence:** Pet restrictions  
I am writing, because as a resident of Hatteras Island, I have some objections to your proposals for beach access restrictions. In particular, I object to the proposed pet restrictions. As a pet owner, I actually bought my house here on the Outer Banks so I could walk with my dogs on the beach. It is a big part of the culture of the Outer Banks, as most of the rentals here allow pets and it is a big reason why tourists choose the Outer Banks, when vacationing. This will hurt the economy, which is already threatened by beach closings to fishermen. Furthermore, there is no science to support such restrictions.  
My pets are always on leashes and we enjoy walking the shoreline. It has been awful, the last two years, with so many beaches being closed to us. Since birds do not nest on shorelines, it seems unfair to close the beaches to pedestrians and pets. It is an infringement of my freedom.  
Real estate rentals will surely suffer if pets are restricted from the beaches. Many tourists come here for this reason, because they can bring their pets. Most house rentals allow pets for free, or a nominal fee. If pets are no longer allowed on beaches, tourists will choose other vacation destinations where pets are welcome. The economy here is already failing, due to two years of beach access restrictions. To restrict pets will only makes things worse. The

families who live here rely on tourism for seasonal income.

There are only two paragraphs in your proposal that discuss the culture of the Outer Banks and pets are a big part of that culture, for the residents, as well as visitors. This needs to be addressed.

Where is the science to support such closings? I did research and could find no evidence that pets caused harm or death to the species being protected. Without substance, how can these restrictions make sense? If there is no good reason to restrict pets from beaches, why is this being proposed? Please help to put an end to this proposal. Pets are not a threat to the wildlife on the Outer Banks.

Sincerely,  
Penny Freeland

Mr. Michael B. Murray, Superintendent Cape Hatteras National Seashore 1401 National Park Drive Manteo, NC 27954

Subject: Public Comments - Draft Environmental Impact Statement (DEIS)

Mr. Murray:

I appreciate the opportunity to provide my comments on the DEIS. Like many others, I have concerns that I hope will be considered without prejudice. I disagree with Alternative F in the Draft Environmental Impact Statement. All of the restrictions are far too excessive, especially the buffers around each Piping Plover nest. The US Fish and Wildlife scientist established the appropriate and effective buffer as 200 meters. Peer reviewed science supporting 1000 meter buffers does not exist. That distance equals 771 acres of land for the chicks to forage on. The chicks never forage towards the tide line, always parallel or in the direction away from it. The 1000 meter buffer is totally unwarranted and Cape Hatteras Seashore Recreational Area deserves equal treatment with all other established nesting area buffers! Access corridors around nesting areas would provide valuable access without impairment or damage to protected resources.

I also disagree with permanent closure of Hatteras Inlet and Ocracoke Inlet. National Park Services' own maps show that not one pair of Piping Plovers has nested at either location during the last 3 breeding seasons. There is no legal justification for closing these areas.

The Audubon, Defenders of Wildlife, and Southern Environmental Law Center are the plaintiffs in this current litigation and are responsible for these current actions along with Federal Judge Terrence Boyle. The Supreme Court ruled in Lujan vs. Defenders of Wildlife, 1992, that you must be able to show "real harm" or "injury in fact" in order to sue the government. The plaintiffs did not have the ability to show either by admission of the scientist solicited by the Audubon Society and still do not today. Nonetheless, Judge Boyle granted them standing.

The plaintiff's claim of harm is based on pure speculation, which the Supreme Court says is not enough to grant standing in Federal Court. It is my opinion that the Consent Decree which resulted from the illegal actions of Judge Boyle is null and void.

There is only 1 documented case of harm caused to a Piping Plover chick. In this case, the chick was killed by a Park Service employee checking a nest.

I urge the use common sense and above all?Ethics, when making the final decisions regarding the Access Issues at Cape Hatteras National Seashore "Recreational Area." Consider the plight of the business owners, families, and property owners that depend on visitors for their livelihood. It will be unfortunate if the future of this community is determined based on the speculation and opinions of environmental extremist and one judge, rather than the legal justification required as established by the Supreme Court. Consider too, the public's right to access to a treasured environment to which, it also, has a rightful place.

The generous citizens who donated the land to the National Park Service and citizens of the United States were promised by the Congress of the United States of America that we would always have access, not "partial access." I respectfully request that these promises not be disregarded in this decision.

Respectfully,  
H.L. Browning

**Correspondence:** Dear Parks Department:

I am writing, because as a resident of Hatteras Island, I have some objections to your proposals for beach access restrictions. In particular, I object to the beach access restrictions set forth in your preferred plan, F.

I believe restricting access to the proposed 8 beaches, plus the closing of the inlets to ORV's and pedestrians will have a disastrous affect on the economy on Hatteras and Ocracoke Islands. Since the implementation of the court decree, the businesses here have been steadily failing. How could this not be true, given that the islands depend upon fishermen, sports enthusiasts and tourists, for the majority of its income.

Closing the beaches means fewer visitors to the two islands. This has already been happening during the last two years and the proposed plan F will be even more restrictive, resulting in even fewer visitors to the islands.

Fewer visitors means that my house value will go down. I could understand this, if there was science to support it, as I would not want to hurt any form of wildlife, but the fact is that the plover population has actually dwindled with the current restrictions court decree that is currently in place. The truth is that the presence of pedestrians and ORV's is actually beneficial to the birds in questions, as it keeps the other predators away.

It does not make sense to restrict beach access on an Island that only has beaches to offer its visitors. We do not have major attractions, outside of the ocean and sound. The closing of Cape Point won't do anything for the birds, as it is too transient a place for birds to nest. This is also true of the inlets.

We will quickly fall without open beach access. We need a plan that will protect the birds, as well as the families who live on the islands and depend on tourism for survival.

You need to complete an analysis of the cultural impact these restrictions will have on the islands, as required by the National Environmental Policy Act. I urge you to do so before any permanent plan is implemented.

Sincerely,  
Penny Freeland

**Correspondence:** As an avid angler on the North Carolina seashore, I am strongly opposed to the National Park Service (NPS) preferred alternative, Alternative F, in the DEIS and urge you to make significant changes to the preferred alternative in order to provide both reasonable resource protection and reasonable public access to public land. Recreational fishing is one of the most enjoyable American pastimes, and Cape Hatteras National Seashore has some of the best surf fishing locations on the east coast ? accessible only by ORV.

Alternative F is the most restrictive management option to date, far exceeding any sense of balance between resource protection and public access and betraying all promises made to the public regarding recreational uses in the seashore. The majority of the provisions included within the preferred alternative far exceed anything proposed by a majority of the Negotiated Rulemaking Committee, including excessively large resource closures (buffers), unnecessary year-round and floating closures, and the lack of access corridors around or through resource closures.

In order to restore balance to the DEIS, I highly recommend that the NPS revisit the proposal put forth to the Negotiated Rulemaking Committee in

December of 2009. It provides the necessary protections for wildlife resources while having the support of a majority of the local community. Without reasonable ORV access, responsible anglers like me, and the local economy that is supported by recreational fishing, suffer greatly. I urge you to provide a better balance between resource protection and recreational uses by incorporating the December 2009 recommendations from the Negotiated Rulemaking Committee into the preferred alternative.

**Correspondence:** I am writing, because as a resident of Hatteras Island, I have some objections to your proposals for beach access restrictions. In particular, I object to your preferred plan F, which restricts beach access to pedestrians.  
There is simply no science to support these restrictions. Pedestrians are not a threat to the wildlife on our beaches. We have always been stewards of this island!  
Please do not close our beaches to pedestrians.

**Correspondence:** Mr. Murray,  
It has been brought to the attention of the kiteboarding community that a variety of plans are being considered in response to proposed environmental and ecological concerns. The Outer Banks of North Carolina is a sanctuary for many beach goers, sports enthusiasts, wildlife observers and most importantly, the natural environment. We, as a community, feel that it is important for the environment to be protected and thus understand certain steps may be needed to achieve this goal. Thank you for evaluating the options to improve the environmental conditions at one of the greatest destinations in the United States of America.  
However, with the aforementioned said, please consider the responses you choose carefully. Minimalist environmental management approaches have worked well throughout the United States?? National Parks. Closing extensive sections of beaches, the sound, and water ways will strip away the very nature and reason for why we appreciate the land in its current state. It can be said with great certainty that all frequent and casual users of this place intend to preserve its natural beauty and respect its wildlife.  
We strongly feel that the Historical, Cultural, and Economic ramifications of the proposed plans have not been adequately addressed by the Draft Environmental Impact Statement (DEIS) as is required.  
Should the environmental changes impact our communities?? sport (as it would in Plans D, E, & F) we would be forced to reconsider our frequent and environmentally friendly utilization of the Outer Banks. Other user groups such as surfers, fishermen, beachcombers, and virtually all other forms of tourism will also be discouraged from visiting Cape Hatteras if beach closures are greatly expanded. This will have a severely negative impact on the local economy and way of life that the residents of Hatteras Island have enjoyed for many generations. It will also take away something that is important to the lives of thousands of people throughout the United States and around the world.  
If people, and especially children, can not experience the environment how are they going to learn to help you protect the environment?  
Kind Regards, David Hults

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more

balanced final plan for all visitors that better protects the natural resources of the Seashore.

Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
With humans emphasizing economic growth for the few centuries, we are at a point where a new type of growth needs to be emphasized: inner growth. Reducing or preventing ORV allows for people to truly connect to their world. So, this alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
 I firmly believe that the protection of the plants and animals that live on the seashore should have priority over vehicles and pedestrian traffic. There are lots of other places for people to drive but not many other places for these precious birds, turtles and sealife to inhabit.  
 This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
 The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
 \* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
 Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
 This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
 The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
 \*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
 \* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
 \* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. For many years, our family spent our summer vacation on the Outer Banks. We have many fond memories of our times there. We are avid birders and would strongly support any means which can be taken to protect the birds and sea turtles in the area,

**Correspondence Type:** Web Form  
**Correspondence:** To: Mike Murray, Superintendent Cape Hatteras National Seashore Manteo, NC 27954

Regarding the National Park Service (NPS) Draft Environmental Statement (DEIS) I would like to comment as follows: The Cape Hatteras National Seashore Recreational Area (CHNSRA) was established by Congress in 1937 for the use of the citizens of this country as a recreational area. The DEIS plan will violate the long standing historical and cultural heritage of the area. Beach driving was the main route of transportation prior to the building of paved roads. Beach driving has continued throughout the history of the island for access for commercial and recreational fishing, many other recreational activities as well as to provide access for the handicapped to areas that would otherwise be inaccessible. The CHNSRA was established for the residents and visitors of the islands. It is for recreation, it is not a wildlife preserve. There are other vast areas set aside for wildlife preserves such as Pea Island which are not open to ORV traffic.

I disagree with the DEIS Restrictive Species Management Areas (page 468) and I feel that ML1 is overly restrictive. I urge the NPS to adopt the corridors and bypasses as outlined in the Coalition for Beach Access Cape Hatteras National Seashore Recreational Area ORV Access Environmental Impact Position Statement as a more commonsense and reasonable plan. I disagree with the DEIS large, inflexible buffers (pages 121-127) as I feel they are too extreme. The current 1000 meter buffer for nests equals 771 acres per nest, this is far exceeds any realistic and reasonable need for protection of the nests. The Piping Plover breeding/nesting buffer should not exceed 50 meters. The unfledged piping plover chick buffer should not exceed 200 meters and should move with the brood as it relocates to reliable food sources not simply expand. These ORV buffers as well as corridors should be maintained to allow ORV's to pass through or around nesting areas to ensure beach access is always maintained.

The NPS should aggressively pursue the adaptive management initiatives identified in the DEIS with an object to improve its success with both resource protection and visitor access (p.124).

NPS Resource Management Pedestrian / ORV closure policies address the least significant factor affecting nest survival with little chance to have more than negligible impact ?for example: AMOY Nest Failures are Predominately due to non-human Events Mammalian Predation: 54%- highly significant Storm / Lunar Tides: 29% -highly significant Nest Abandonment: 6% Avian Predation: 5% Ghost Crab Predation: 3% Human Interference: 3%-least significant

The NPS does not adequately consider locations neighboring the Recreational Area that are part of the same ecosystem such as villages, dredge and spoil islands and Pea Island National Wildlife Refuge. The dredge and spoil islands typically have fewer predators to threaten nesting birds. Bird activity within neighboring areas should be tracked and included in target productivity levels. Fluctuations and trends in Recreational Area bird populations should be viewed relative to regional and state experiences ?not in isolation.

I disagree with the NPS statement: "ORV and other recreational use would have long-term major adverse impacts on sea turtles due to the amount of Seashore available for ORV use and by allowing night time driving on the beach." (p. 377). In actuality, Nesting females have not "been killed", complete or partial nest lost due to human activity has not "occurred frequently", hatchling disorientation/disruption due to humans have not "occurred frequently" and direct hatchling mortality from human activity has not "frequently occurred". The main danger to the nests is natural predators and weather with ORV driving having a minimal impact. The NPS should adopt more proactive techniques such as used at other east coast locations to improve the protection of the nests.

The island economy has already been severely negatively impacted due to the consent decree restrictions. The current DEIS will only serve to be even more restrictive and it will surely further devastate an already precarious economic situation for the people of the island villages. The Region of Influence (ROI) incorporates the northern beach communities, including Southern Shores and Duck. These areas are almost completely disconnected from ORV use and access issues relating to the seashore villages. Inclusion of the northern beaches in analysis significantly dilutes estimates of economic impact on the seashore villages. Analysis of economic impact to the seashore villages appears to be significantly down played. Emphasis in DEIS is on the ROI-wide or county-wide level impacts. Nowhere is it clearly addressed that the overwhelming majority of negative impacts will be felt by small businesses in the seashore villages rather than by overall economic interests within the greater ROI.

Economic analyses in the DEIS do not use data from the first full year of the Consent Decree (2009) thus do not present an accurate picture of economic impact to the seashore villages. Many 2008 visitors were either unaware of the scope and breadth of Consent Decree beach closures, or had already made plans/reservations. Actual seashore village business survey data should be used rather than the model projections currently in the DEIS.

Overall visitor counts appear to include visitors to Fort Raleigh National Historic Site and the Wright Brothers National Memorial. A large percentage of these visitors vacation in the northern beaches communities and recreate on the non-federal beaches outside of the Seashore. Visitors who patronize the Fort Raleigh National Historic Site and the Wright Brothers National Memorial but do not visit the actual seashore areas need to be factored out. The definition of the Region of Influence (ROI), faulty data on economic activity generated by specific type recreational activity, incomplete visitation/business survey data, inflated overall Seashore visitor counts pertaining to beach use, and flawed key assumptions concerning the maintenance of access under Alternative F, all lead to inaccurate conclusions in the socioeconomic analyses. Specifically, these inaccuracies can be seen as understating the negative socio-economic impact of the Seashore Villages. Further, this negative impact will be absorbed almost entirely by Small Businesses. Neither of these important aspects of the management alternatives are adequately presented in the DEIS.

I find it morally unacceptable that the NPS has been actively killing hundreds of various predator species in the park. It is also a financially irresponsible use of tax dollars for the murder of innocent animals. Human and ORV presence is a significant deterrent to predators, if access is limited, more killing will be needed to "protect" the birds and turtles.

I strongly urge the NPS to carefully consider the Coalition for Beach Access Cape Hatteras National Seashore Recreational Area ORV Access Environmental Impact Position Statement The positions stated in that document and its attachments represent a common sense, reasonable approach to address two of the most significant responsibilities the National Park Service must fulfill within the ORV Management Plan. These responsibilities are: The protection of resources without impairment to or from the visiting public and the protection of Traditional, Cultural, Recreational and Commercial values for the visiting public with limited disruption. The goals written by Congress in the enabling legislation that created the Recreational Area recognized these responsibilities. The Coalition is confident ORV access to the beaches has not historically adversely affected the Recreational Area

environment. The Coalition is equally confident that, in the future, the ORV management plan guidelines it endorses will not negatively impact the environmental qualities that were responsible for the creation of the Cape Hatteras National Seashore Recreational Area and its continued popularity.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
Cape Hatteras is a place near and dear to my heart, having vacationed there dozens of times since I was 5 years old in the late 1950s. Over the years, I have seen the growth of off road vehicles on the beaches, and it makes me very sad. And to learn that these vehicles are causing great harm to nesting bird groups and sea turtles makes me mad.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent

degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Honestly, I don't think it at all appropriate for ORVs to be using such a location. The idea is to enjoy and preserve nature. People wanting to use those should go to an indoor track/park where they can keep the fumes, noise, disturbance and destruction to themselves. It doesn't make any sense at all to be using these in a national park much less on beaches.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are

management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. **Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
ORV's already have an overwhelming portion of the seashore to motor around on. I certainly enjoy driving them myself on designated trails but see no reasonable argument to allow unlimited access on the shore 12 months a year. The National Seashore's primary directive should achieve a balance between wildlife protection and a natural recreation area for all people. I can guarantee that if you're not actually driving one of these ORV's, then the noise, danger and environmental damage associated with these practices would negatively impact one's experience, let alone the wildlife.  
I assume the ORV contingent is worried that this statement would set a precedent and slowly, the amount of seashore available to ORV will diminish. Frankly, it appears this over-represented portion of the population has had more than enough access and privileges to practice their unequivocally destructive pastime over the years. It's time to responsibly manage the seashore for everyone's enjoyment and everything's existence, not simply for the segment that produces the loudest noise.  
Sincerely, Simon Kline Wilmington, North Carolina

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

The problem seems to be that people cannot learn to share this national parks. Have a area for the ORV'S and leave enough room for people who want a quiet beach, and want to protect the wild life. We cannot let a small group of assertive individuals take over the whole place. We have the same problem in the mountains of Western North Carolina where noisy motorcycles and ORV's tear up property.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

Dear Superintendent Murray,

Thank you for the opportunity to comment on the Nat'l Park Service's proposed plan to manage ORV use on Cape Hatteras Nat'l Seashore.

Of the alternative plans presented, I support Alternative D if modified to provide greater pedestrian access. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife. Both features are important to me. I last visited the Cape in the mid-1970s, but have long looked forward to a return visit. I have been saddened to learn that off-road vehicles have been able and allowed to pre-empt or disturb wildlife habitat and pedestrian use.

Whether based on Alternative D or developed in another way, the final plan for the park should include the following features:

\*Fair and balanced access for all visitors.

Under NPS' preferred Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach: less than 1/4. This balance would be unfair. At least half of the beach should be available year round for non-ORV users and wildlife, preferably with more walkways and better access facilities., this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to historic numbers and diversity.

\* Priority to protection of natural resources

Recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species.

Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and may require increase to protect breeding birds and sea turtles.

\* Clear wildlife recovery goals

A plan must include clear goals and milestones for wildlife recovery. Management targets in the DEIS need to be based on the historic potential of the Seashore to support wildlife rather than on its recent degraded abilities. Goals are needed for migrating and wintering species as well as for breeding species.

\* Management to realize the recovery goals

Management must be adequate to realize the recovery goals. Based in annual reviews, additional protective measures for birds, turtles and plants should be instituted until the goals are met.

Thank you for the opportunity to provide these comments. I look forward to a final plan that provides better balance for all visitors and better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** Cape Hatteras National Seashore is a gem! It is a place that can not be experienced anywhere else in the world. My family goes there twice a year to vacation all the way from Indiana. It would be terrible to think that our trips to the beach would be limited in the future because the beach access is limited. Please listen to the people of the Outer Banks and all that love it and keep the beach open!  
Thanks

**Correspondence:** While I respect the wildlife of our state and country, this is excessive. The harm to our economy is significant and underestimated. In these almost impossible economic times the hardship to our state, business's on Hatteras Island the hardship it would cause my family may be unrecoverable. Please do not allow the closure of our beaches and harm tourism beyond repair to Hatteras Island.

**Correspondence:** May 6, 2010 To National Park Service of Hatteras Island, NC Mr. Mike Murray, Superintendent  
 As a longtime property owner, vacationer, fisherman and dog-lover I find your proposed ORV Management Plan beyond the boundaries of good management practices. What you are proposing will significantly impact the overall economic viability of Hatteras Island and the people who have lived and worked there for generations. I am sure that you can go back to the "drawing board" and come up with a plan that will insure the Island will stay the wonderful wildlife preserve that it is, but not mean economic disaster for the people that depend on the beaches, sound and ocean for their livelihood. The rules and policies that you want to adopt have a far-reaching scope that covers all human access in addition to resource management within the recreational area. I am in total disagreement with your projected plan and would like you to reconsider this project. Should you wish to contact me I may be reached by e-mail at salayman@directv.net. Sincerely, Sharon A. Layman

 I am a conservative and a lifelong sportsman/hunter-not your stereotype bunny hugger.I am also a combat disabled veteran-and if I can enjoy this park without a noisy,smelly ORV then so can the mostly overweight, lazy people that rely on them.Let us leave the beach the way God made it,for our kids and their kids to use in peace.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be

consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Please protect the wildlife at Cape Hatteras National Seashore. Do not allow off-road vehicles to destroy the scenic beauty and conservation efforts.  
Thank you!

Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
 \* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
For too many years, the interests of ORV groups, which represent just a small, but very vocal, percentage of Cape Hatteras visitors, have outweighed the interests of the two million people that visit this dynamic seashore every year. As the Park Service's DEIS points out, what is decided now will guide what happens at Cape Hatteras for decades and will set a precedent for other national parks.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. **Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

My husband and I will be retiring next year and will be traveling to many of the places on the east coast where we can see wildlife, especially birds. We hope that enlightened management at Cape Hatteras will make this a stop that still has many birds to see.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
I can't tell you how long it's been since I stopped bothering to visit beaches in my own area because of the smell of gas fumes from ORV's and jet ski use. ORV's really don't belong on the beaches, but limited use should be OK for all if that is the only way to give everyone equal access and save the animals who rely on the area to breed and live.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Having grown up in the area, I used to love watching the birds and thus started my lifelong interest in birds. Please allow our children and grandchildren an opportunity to do the same. People go to the beaches to enjoy the scenery and feel of being out of the city and someplace more natural. It gives them a chance to recharge and reconnect with the world that will be lost if the wildness is destroyed and the natural sounds of wind and surf are obliterated by motorized vehicles. Please preserve this environment.

The vast majority of people who use our national parks do not use these accursed off road vehicles. They have to be controlled and kept away from damaging wildlife.

Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan

are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be

implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which should be the purpose of a protected seashore.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\* Protection of the natural resources and wildlife of the Seashore should come first, and any recreational use should be consistent with this protection. I believe that beaches should be free of vehicles, but the preferred plan fails to set aside areas that are free of ORV use year round in order to protect the wildlife. Wildlife protection must be based on the best scientific information.  
\* Establish and Meet Clear Goals for Wildlife Recovery. Your plan must include clear goals for wildlife recovery. The management targets in the DEIS, require more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection.  The last habitats available to animals should not be destroyed. Our country and our world are at a tipping point for habitat; there is simply no more to develop.  
 This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

My mother's family is from North Carolina, and I have always wanted to see Cape Hatteras. Please do what you can to protect the wildlife there. If I ever do get to make the trip, I hope to be in a place that protects birds and turtles and where the sounds of wind and waves are not drowned out by ATV's and "beach buggies."  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
I know about the impact of ORVs on endangered beach-nesting birds from firsthand experience. I'm the president of the North Fork Audubon Society, located on the North Fork of Long Island, New York.  
Like Cape Hatteras, we have long, sandy beaches that provide the ONLY nesting environment that Piping Plovers and Least Terns, among others, will use.  
The numbers of these birds are so diminished, every single fledged chick counts towards the survival of the species. And ORV's are an EXTREMELY significant threat. As significant as high tides, storms, gulls, raccoons and domestic and feral cats. I have personally witnessed FLATTENED plovers in tire tracks on the beach. The vehicle barrels along, and the nesting bird, stay on the nest, not moving. End of story.  
These birds must be able to use the beaches safely, to ensure reproduction of the species. If their nesting habitat continues to be lost or compromised, these species will become extinct.  
This is the reality. I'm not exaggerating.  
Sincerely, Diana Van Buren President, North Fork Audubon Society

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

Have you ever tried to be on a beach where ORVs are? One ORV with two people on board can make it impossible for 100 families to enjoy a stretch of beach. And the "fun" the folks in the ORV have is so destructive!!!! Their destruction of the beach and the flora and fauna remains decades after they have gone home.  
This is just wrong. Keeping half of the beach safe from destruction seems to me to be a bare minimum of what should be set aside. The impact of ORV on the environment is way out of proportion to the number of people "enjoying" the beach in this destructive manner.  
Save the beach for the people who want to treasure it, not for those that want to destroy it.

Believe is or not, survival is not all about us. We need a healthy biosphere for the human race to survive. We don't need one destroyed by ORVs. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me. The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

**Correspondence:** Cape Hatteras National Seashore holds a unique ecological, recreational and economic value. I believe that beaches are a public resource and should be held in the public trust for their preservation. Cape Hatteras National Seashore provides some of the best recreational resources on the East Coast, including surfing and fishing, but I recognize that if not regulated correctly ORV use may detrimentally affect migratory species that nest in the area. I believe that a balance between access and preservation can be achieved and that allowing continued access with improved management of ORV use to the National Seashore is the optimal solution for this area.

As a homeowner of the Outer Banks, (Avon) and a stakeholder in the long term preservation of the Outer Banks, I support Alternative C, a balanced solution that benefits the animal species while guaranteeing humans can continue to enjoy and protect this most-precious coastal resource for years to come.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

By the way, I myself am a surf fisher, and I greatly enjoy coming to the OBX regularly to fish and enjoy the region's glorious bounty. I spend a lot of money around the local economy. Will ORV restrictions impact my ease in reaching those 'sweet spots'... the answer is, honestly, yes. However, wildlife conservation and recovery is far more important than any minor inconvenience I may suffer in getting to my favorite fishing points. I can and will adapt to whatever methods are proven to protect this beautiful resource and the creatures that call it home. There are always new places to hike in and fish, and - for us humans - recreational fishing is a hobby. For wildlife, this is species survival we are discussing. It's no game to them. It is life or death. If the figures are true/accurate, then they are alarming, and I will gladly support directives that work to ensure native species repopulation and growth.

\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.

\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

The wildlife and flora that are endangered and threatened by ORV use are the very things our citizens go to such beautiful national landmarks such as Cape Hatteras to see. Please do not make the terrible mistake of allowing ORV use for the few at the expense of the many.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

- \*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.
- \* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. **Correspondence:** All,

I strongly supports open and accessible beaches for the Cape Hatteras National Seashore Recreational Area. I believe in open access for everyone consistent with the enabling legislation that created America's first National Seashore.

I support resource protection for sea turtles and shorebirds. However, the buffers for the birds are too extensive and should be scaled back to more reasonable levels and access corridors should be allowed in all cases so that the public can access the open beach areas down the beach line as outlined in Dare County's DEIS Position Summary Statement (Page 7 ? Appendix "A").

Sincerely,  
35 Year Cape Hatteras Vacationer

**Correspondence:** I disagree with the beach closings. For the last 33 years I have been enjoying the beaches of the Outer Banks as a vacation spot. I believe the environmentalist are wrong thinking that the beaches can not be shared equally by humans, pets and wildlife. Please do not close the beaches of Cape Hatteras. It would be a tragic lost/waste.

Denice Burke Glen Allen, VA

Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
 \* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
 \* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
 Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
 This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
 The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
 \*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

The current oil spill in the Gulf of Mexico add to the clear evidence that we have to take every possible precaution to protect our natural resources and the animals that are already challenged by our encroachment into their environment.

**ADDITIONALLY, I WOULD LIKE TO COMMENT THAT IT IS APPALLING THAT ORV VEHICLES ARE ALLOWED ON ENVIRONMENTALLY SENSITIVE LANDS AND BEACHES. THIS, NOT TO MENTION THE YEARLY RUN-OVERS AT BEACHES WHERE PEOPLE ARE INJURED OR HARMED. THIS TYPE OF VEHICLE SHOULD NEVER BE ALLOWED IN ANY ENVIRONMENTAL AREAS OR BEACH AREAS EVER. I AM PERSONALLY FRIGHTENED TO GO TO ANY OF THESE BEACH AREAS FOR FEAR SOMEONE WILL RUN OVER ME LET ALONE THE SEABIRDS AND TURTLES. SO, IN ESSENCE MY RIGHT TO GO TO THE BEACH IS ALSO BEING DENIED DUE TO FEAR OF INJURY. WHERE ARE MY RIGHTS? LET THESE PEOPLE GO TO DESIGNATED ROUGH TERRAIN AREAS AND CONTROL THE USE OF THESE VEHICLES.  
STOP ABUSING THE WILDLIFE AND ENVIRONMENT ... WE ARE THE CARETAKERS OF THESE CREATIONS, AND HELP US ALL WHEN THEY GO INTO EXTINCTION!**

It seems that there is enough human induced pressures on our wildlife. Making space for wildlife that make these beaches home as well as nest sites, should be a priority. Cape Hatteras is a treasure. I have spent many summers there and hope to be back soon.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
Please take this chance to allow the birds of Cape Hatteras and pedestrians enjoy the tranquility of nature unharrassed by off road vehicles.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.  
This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:  
\*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.  
\* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.  
\* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.  
Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.  
We're not doing a very good job for wildlife in the Gulf right now - I'm seeing adult sea turtles washing ashore that have died from the oil spill. Let's start trying to do a better job!  
The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

We love this area because of the beauty and wildlife. This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:

- \*Provide Equal Access for All Visitors. Under the National Park Service's preferred plan, Alternative F, ORVs would be prohibited year round on only 16 of the 68 total miles of Seashore beach. This does not represent a fair balance for other users and wildlife. If ORV use is allowed within the park, at least half of the beach should be available year round for non-ORV users and wildlife. Combined with more walkways and better access facilities, this approach would provide balanced access for all visitors. Pedestrians and families could then more safely enjoy the Seashore, and wildlife could have a chance to rebound to its traditional numbers and diversity within the park.
- \* Put Natural Resources First. Protection of the natural resources and wildlife of the Seashore should come first, and recreational use should be consistent with this protection. The preferred plan fails to set aside adequate areas that are free of ORV use year round for wildlife including breeding, migrating, and wintering species. Wildlife protection must be based on the best scientific information. Wildlife disturbance buffers in the preferred plan are minimums and should be increased if necessary to protect breeding birds and sea turtles.
- \* Establish and Meet Clear Goals for Wildlife Recovery. A plan must include clear goals and milestones for wildlife recovery. Where there are management targets in the DEIS, they need more thorough vetting based on the potential of the Seashore to support wildlife rather than on its recent degraded abilities. Where birds, turtles, and plants are not coming back as planned, based on annual reviews, additional protective measures should be implemented until recovery goals are met. These goals, and adequate management to realize them, should be for migrating and wintering species as well as breeding ones.

Thank you for the opportunity to provide these comments. I will be following the progress of your efforts at Cape Hatteras and look forward to a more balanced final plan for all visitors that better protects the natural resources of the Seashore.

**Correspondence:** I disagree with the beach closings. I have been enjoying the beaches of the Outer Banks for the last 5 years. And want to continue doing so. I disagree with the environmentalist that the beaches can not be shared equally by humans, pets and wildlife. There is plenty of beach for all to go around.

Please do not close our beaches.

Thank you, Oliver Letourneau Aylett VA

**Correspondence:** Thank you for the opportunity to comment on the draft Cape Hatteras National Seashore Off-Road Vehicle Management Plan/Environmental Impact Statement (DEIS).

I am opposed to the plan as written for the following reasons.

As a non-resident homeowner on Hatteras Island as well as a frequent visitor since 1969, the plan is far too overreaching and does not appear to be based on substantive, complete, analysis and evaluation. Specifically, out of the entire plan only two paragraphs are dedicated to the analysis of the

preservation of cultural resources. It would seem to me that analysis of all factors and objective conclusions should precede any proposed plan. Hatteras Island is home to a small, close-knit, community in which the residents care about each other as well as the environment in which they live. Visitors to the island appreciate and share those same values. Those on the island, residents and visitors, respect and preserve restricted areas such as those for turtle nestings and hatchings. The approach to preserving and enhancing the turtle population is reasonable and workable for all. This plan vastly limits beach access, particularly during certain times of the year. Though a threatened species, loggerhead turtle conservation plans coexist well with beach access regardless of the time of the year.

As I understand it, the Piping Plover is near-threatened. It is not threatened (including all three supporting UNIC 3.1 categories) or extinct in the wild. Providing for 1000 meter, or about 771 acres, closure in all directions of an unfledged chick broad appears to be very overreaching and unreasonable. Similarly, requiring a 300 meter all-direction closure around a American Oystercatcher appears to be in a similar overreaching manner. Furthermore, the American Oystercatcher is not federally threatened and is considered 'least concern' regarding its conservation status. These proposed closures are substantive and burdensome.

The year round residents and visitors are considerate of their environment. They keep the beaches clean, observe off road regulations, and respect all types of beach and wildlife preservation efforts. Overly limiting beach access will impact tourism to the area, the local economy, and investment in the area. This cannot be overstated. Decisions of this magnitude, such as implementing this proposed plan in April 2011, without substantive analysis and consideration for all factors are unacceptable to all. A plan that is a workable solution for all stakeholders is essential. There is a balance between maintain and hopefully improving the status of these species' conservations status and that of impact to the residents and visitors of Hatteras Island, but this is not it.

Please do not implement the proposed plan as written but instead require an objective study of all the pertinent factors (wildlife, economic, social, financial, etc) followed by a proposed plan for public comment. Respectfully submitted,  
Nate Davis

**Correspondence:** I completely disagree with your plan to interfere with the enjoyment of the Cape Hatteras National Seashore. Please stop trying to regulate Mother Nature. Humans are as much a part of the ecology of any environment as any other creature. If any other species moved in to the area that you are trying to regulate and caused the same (unlikely) events that you believe would occur without regulation, you would (or more appropriately, should) consider it natural selection, i.e., survival of the fittest. However, you deem that some humans - usually remote, city-based so-called "environmentalists" somehow have all of the facts on their side, know what's best for the planet's survival, and can therefore dictate what will be required of the rest of us, who clearly must be wrong.

The folks that want to enjoy the beaches, their homes AND Mother Nature in this area will be completely and unnecessarily hampered by these draconian rules. Reasoned compromises have clearly been offered and should be considered carefully. My home is in Duck, NC so I'm not even directly impacted by this government interference, but I feel their pain. Leave things alone. The birds and turtles will survive and adapt. All beings can coexist if given the chance. This is just another example of government and self-righteous know-it-alls' sticking their noses where they have no business. Work with the residents, the fisherman, the homeowners, the investors, the local merchants, the pedestrians, the ORV'ers, and all the others whom this truly affects. Come up with a better compromise and please, please don't assume that the Washington-based "environmentalist" lawyers must be right.

**Correspondence:** I appreciate the opportunity to comment on the National Park Service's proposed plan to manage ORV use on Cape Hatteras National Seashore. Of the alternative plans presented in the draft environmental impact statement, I support the identified "environmentally preferred" Alternative D if modified to provide greater pedestrian access.

This problem has been going on for much too long. It is now much past time to do this right!!

This alternative plan would provide more opportunity for non-ORV uses of the beaches and result in less disturbance of wildlife, which are important to me.

The following principles should underpin the park's formulation of its final plan, should it not choose to enact Alternative D:
